## **EX/7-2Ra: New Meso-scale Electric Fluctuations Interacting with Magnetic Islands and Turbulence in Edge Plasmas of HL-2A**

*Friday, 12 October 2012 08:30 (4 hours)*

New meso-scale electric fluctuations (MSEFs), having two components of  $n=0$  and  $m/n=6/2$  potential fluctuations, are first identified in the edge plasmas of a tokamak. The MSEFs coexist and interact with the magnetic fluctuations with two components of  $n=0$  and  $m/n=6/2$  (magnetic islands). The MSEFs also coexist and interplay with turbulence and low frequency zonal flow. The MSEFs mainly modulate the turbulence of frequencies higher than 100kHz and lower than 200kHz.
