FAO/IAEA International Symposium on Plant Mutation Breeding and Biotechnology

Contribution ID: 281

Type: Oral

SOMACLONAL VARIATION: CONTAINING THE BAD WHILE EXPLORING THE GOOD

Somaclonal variation describes random cellular changes in plants regenerated through tissue culture. It occurs in certain crops that undergo micropropagation, and has been recorded in different explant sources, from leaves and shoots, to meristems and embryos. In banana (Musa spp.), a clonal crop conserved in vitro, somaclonal variation has been observed after prolonged periods in tissue culture, resulting from an increase in subcultures performed on a given clone. According to scientific literature variants, or off-types, often show characteristics such as abnormal growth and flower or fruit defects, in frequencies ranging from 1% to 32%. This variation poses a problem for gene bank managers, whose mandate is to maintain the genetic integrity of their collections for research and breeding. In the case of the Bioversity International Musa Germplasm Transit Centre (ITC), stress during the in vitro process is minimized by various techniques and plants are regenerated after 10 years, making it a long and costly process. Identifying somaclonal variation at an early stage would be an ideal solution; however, this requires suitable molecular markers. Recent studies revealed that techniques such as direct DNA sequencing and single nucleotide polymorphisms (SNPs) are able to detect the underlying factors of somaclonal variation, and are becoming more accessible. On the other hand, somaclonal variation can be beneficial as it allows the natural development of new varieties and supplies genetic stocks used for future genetic studies. Harnessing the diversity of somaclones is easier, faster and cheaper compared to other methods of crop improvement, although it is also less predictable. So far, variants of crops such as apple, strawberry, potato and banana have been successfully adopted in global markets. In this presentation, we will discuss how to minimize the adverse effects of somaclonal variation while maximizing its benefits for greater crop diversity, with a particular focus on banana.

Country or International Organization

Bioversity International

Author: Dr ROUX, Nicolas (Bioversity International)

Co-authors: Dr SARDOS, Julie (Bioversity International); Mr ROUARD, Mathieu (Bioversity International); Mrs CHASE, Rachel (Bioversity International); Mrs MONTAVO-KATZ, Sirena (Bioversity International); Mrs INES, Van den Houwe (Bioversity International); Dr PERRIER, Xavier (CIRAD)

Presenter: Dr ROUX, Nicolas (Bioversity International)

Track Classification: Mutation breeding for ornamental and vegetatively propagated crops
