

AN INNOVATIVE APPROACH TO WEAPONS USABLE NUCLEAR MATERIALS MINIMIZATION

Presented By: Ian Kapuza, U.S. Department of Energy/National Nuclear Security Administration 10-14 February 2020

Efforts To Date

>7,100 kilograms HEU and Pu

More than 320 weapons-worth*

48 Countries and Taiwan

* Assumes one SQ of material is equivalent to one weapon

A New Approach Is Needed

- Diverse, small inventories
- Domestic politics
- Legal frameworks
- Infrastructure requirements
- Economic pressures
- But the threat is still there...

What Though?

- Simple
- Standard cargo containers
- Small footprint
- Standard utility connections
- Batch operations
- Ready on short notice

- PERMANENT THREAT REDUCTION

CONVERT. REMOVE

Enter Melt Processing

Primary Generator Diesel Tank

The Process

- 1. Load basket
- 2. Transfer to furnace
- 3. Dry, heat, stir, cool
- 4. Remove and package
- 5. Dispose

Considerations

- Safety
 - Bottom-load furnace
 - Controlled airflow
 - Shielding
- Versatility
 - Uranium
 - Thorium
 - Aluminum
 - Zircaloy
 - Stainless
 - Metal
 - Oxide
- Modularity
 - Shielding
 - Off-gas
- Durability & Waste Minimization
 - Off-the-shelf components
 - Limit contamination

Benefits

- Nonproliferation: Reduces material attractiveness
- Flexibility: Eliminates wide variety of materials
- Handling: Produces uniform endproducts
- Customization: To meet disposal and other criteria
- **Deployment**: Avoids the need for international shipment of nuclear materials
