# Opacity Calculations for Various Plasmas with the Improved FLYCHK

Opacity, which describes the extent to which the radiation is absorbed and scattered in the material, is essential in understanding the fundamental physical properties of high-energy-density(HED) and astrophysical plasmas. FLYCHK, a collisional-radiative code, has been used to calculate the opacities of HED plasmas under a wide range of conditions due to the simplicity and availability of the code[1,2]. However, it has been confirmed that the FLYCHK opacity has limitations in strongly coupled plasmas due to the problem of free-free opacity formalism[3,4]. In this research, we improve the free-free opacity calculation model of FLYCHK and generate opacities of various materials(Al, H, Au). The FLYCHK opacities are in good agreement with those obtained by the Los Alamos opacity code ATOMIC[5].

This work was supported by the NRF of Korea (No. NRF-2019R1A2C2002864) and the Defense Research Laboratory Program of the Defense Acquisition Program Administration and the Agency for Defense Development of the Republic of Korea.

# **Presenting Author**

Jang Hyeob Sohn

# **Presenting Author Affiliation**

Department of Physics and Photon Science, Gwangju Institute of Science and Technology (GIST)

#### **Presenting Author Gender**

Male

## Country

South Korea

#### **Presenting Author Email Address**

jhsohn@gm.gist.ac.kr

**Primary authors:** SOHN, Jang Hyeob; CHUNG, Hyun Kyung (National Fusion Research Institute, Republic of Korea); CHO, Byoung-ick (Gwangju Institute of Science and Technology); Prof. HAHN, Sang June (Department of Physics, Chung-Ang University)

Presenter: SOHN, Jang Hyeob

Session Classification: Poster Session

Track Classification: High Energy Density Plasmas and Powerful Light Sources
