#### Outline

- Introduction
- Orbit space  $(E, p_m, R_m)$
- Weight Function Formalism
- Orbit weight functions
  - Perpendicular sightlines
    - TOFOR (NES)
    - LaBr<sub>3</sub> detector (GRS)
  - Oblique sightline (NE213 detector, NES)
- WF analysis
- Conclusion and outlook

2

#### Introduction

- Fast ions will play a vital role in future burning plasmas [1]
- Velocity-space tomography reconstructs the fast-ion distribution function at a single (R, z) point [2,3,4]
- 2D  $(E, v_{||}/v)$  sensitivity can be mapped via velocity-space weight functions [5,6,7]
- 3D sensitivity can be mapped via orbit weight functions [8,9]
- Prior to this work, developed for some diagnostics [8,9,10]

#### Introduction

- In this work, we map out how the orbit sensitivity varies with fast-ion and diagnostic energy
- Neutron emission spectroscopy (NES) orbit weight functions for TOFOR[10], an NE213-scintillator[11] and newly developed one-step reaction gamma-ray spectroscopy (GRS) orbit weight functions for a LaBr<sub>3</sub> detector[12] are used as examples
- We demonstrate that orbit weight functions are able to mimic forward model for computing synthetic signals
- Lastly, combine with example fast-ion distribution functions to split synthetic signals into orbit type constituents

**Orbit space**  $(E, p_m, R_m)$ 

Slide keywords: orbit types

### **Orbit space** $(E, p_m, R_m)$

- The full six-dimensional charged particle motion in x and v can be dimensionally reduced to three
- Toroidal symmetry, guidingcentre-picture and  $\nu \tau_p < < 1$
- Well-filled, clear boundaries and no mixing of position and velocity space [13]
- $(E, p_m, R_m)$

[13] JA Rome and YK M Peng 1979 Nucl. Fusion 19 1193

Slide keywords: coordinates

**Orbit space**  $(E, p_m, R_m)$ 

- E is the energy,  $p_m$  is the pitch at the maximum major radius position  $R_m$  of the orbit
- Every realisable (valid) orbit corresponds to a unique  $(E, p_m, R_m)$  triplet

Slide keywords: slice

#### Weight function formalism

- Split orbit into its (E, p, R, Z) points
- Weigh each point by  $\Delta t/ au_p$
- This 'distribution' is sent into the forward model [14]
- $= s(E_{1,d}, E_{2,d}) = \int w(E_{1,d}, E_{2,d}, E, p_m, R_m) \delta(E E_i) \delta(p_m p_{m,j}) \delta(R_m R_{m,k}) dEdp_m dR_m$
- $\Rightarrow s(E_{1,d}, E_{2,d}) = w(E_{1,d}, E_{2,d}, E_i, p_{m,j}, R_{m,k})$
- Put signals as columns in matrix
- The rows are the discretised weight functions  $w(E_{1,d}, E_{2,d}, E, p_m, R_m)$
- The matrix is the weight matrix  $\boldsymbol{W}$

[14] J Eriksson et al 2016 CPC **199** 40-46

59

#### **Conclusion and outlook**

DTU

- Orbit weight functions for NES and one-step reaction GRS have been developed
- Orbit weight functions map out the sensitivity of a diagnostic to fast-ion orbits
- The orbit sensitivity has patterns that can be identified by scanning 3D orbit space slice-by-slice in terms of fast-ion energy while superimposing topological boundaries between different orbit types
- Orbit weight functions are able to mimic forward models for computing synthetic signals
- Lastly, combine with fast-ion distribution functions to split synthetic signals into orbit type constituents
- In future work, orbit weight functions will be used to reconstruct the fast-ion distribution in terms of orbits, which can be transformed to (E, p, R, Z)
