*Murari A., Rossi R., Peluso, E., Lungaroni M., Gaudio P., Gelfusa M., Ratta, G., Vega, J. and JET contributors “On the transfer of adaptive predictors between different devices for both mitigation and prevention of disruptions”, Nuclear Fusion 2020

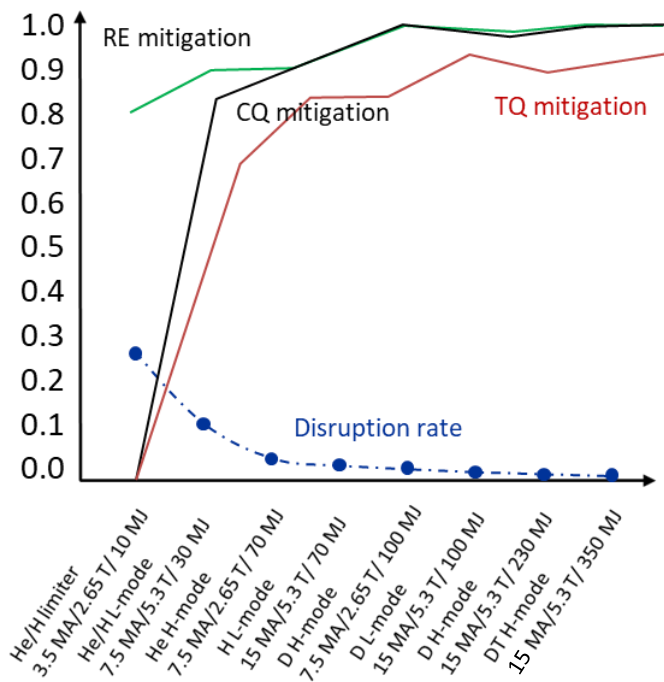

Basic hypothesis of classic machine learning (i.i.d.) is violated in nuclear fusion.

How do we deal with:

- Obsolescence?
- Transfer learning?

Obsolescence

M. Lehen "Challenges of Disruption Mitigation in ITER", EPS 2017

Transfer learning

Solution #1

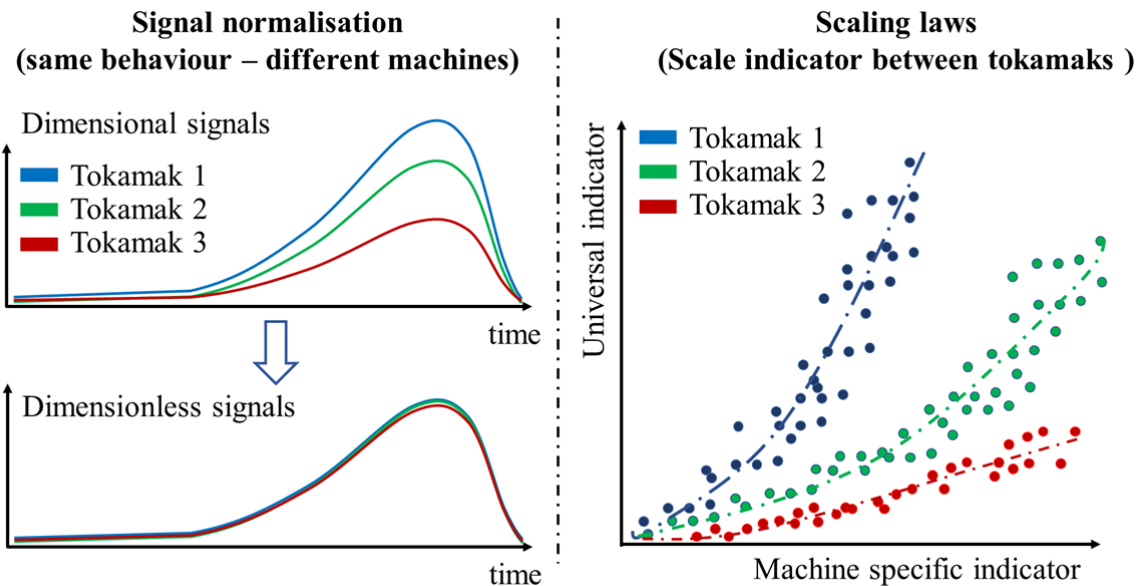

Rendering the training set and test set as “similar” as possible:

- **Dimensionless signals**
- **Scaling laws**

It is not always possible.

Extrapolation is needed for ITER, DEMO, etc.

Are extrapolation corrects? How large is the uncertainty?

Solution #2

Updating the training set with the evolution experimental campaign:

- **Adaptive learning**

The training set is continuously updated (pulse after pulse) to achieve the best performances

Adaptive Machine Learning (From scratch training, evolves after each pulse)

A. Murari et al "Adaptive predictors based on probabilistic SVM for real time disruption mitigation on JET" Nuclear Fusion, Volume 58, Number 5, March 2018

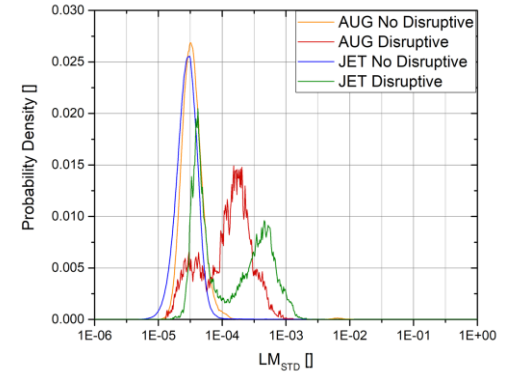

Diagnostics

1. Plasma current
2. Internal inductance
3. Locked mode
Normalized with respect to the plasma current and tokamak geometry (similarly to *P.C. de Vries et al 2016 Nucl. Fusion 56 026007*)
4. Radiation (bolometers)
Normalized indicators

Saddle coils for LM

LM_{STD} pdf in AUG and JET

Bolometer Camera (Horizontal)

AUG Horizontal Camera

JET Horizontal Camera

Predictor

Ensemble of classifiers based on Classification and Regression Trees (**CART**)

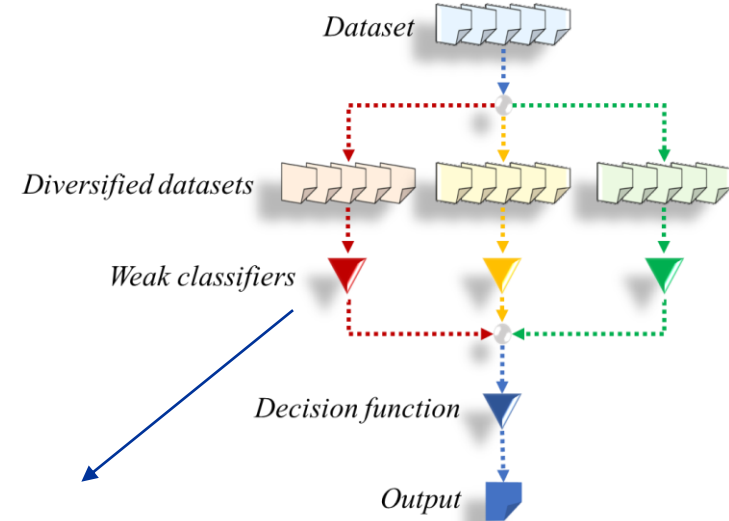

Each classifier is trained with a diversified training set.

A decision function is used to provide a unique decision (disruptive or safe)

Trees per ensemble (Random Forests) = 40

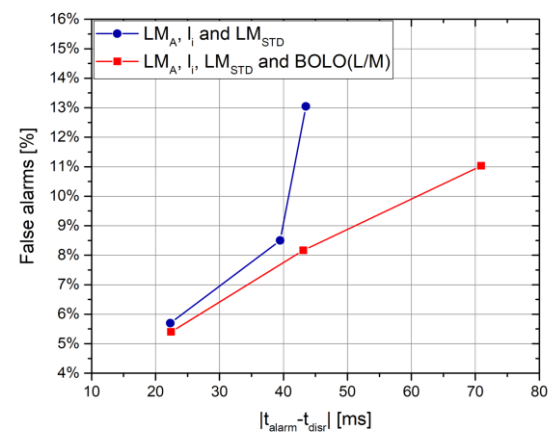

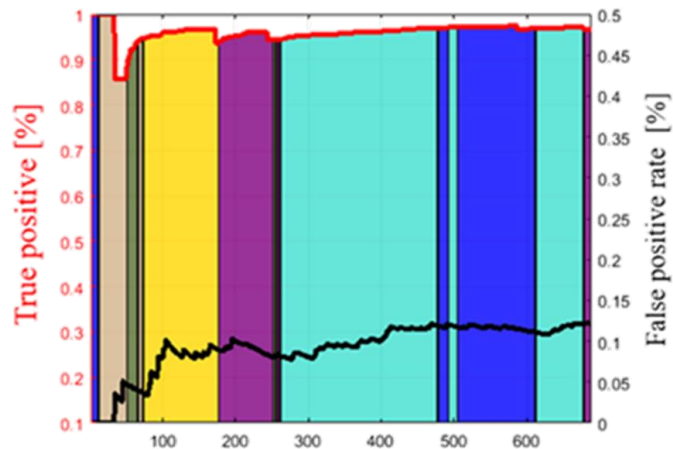

Number of Ensembles = 11

Total weak classifier = 440

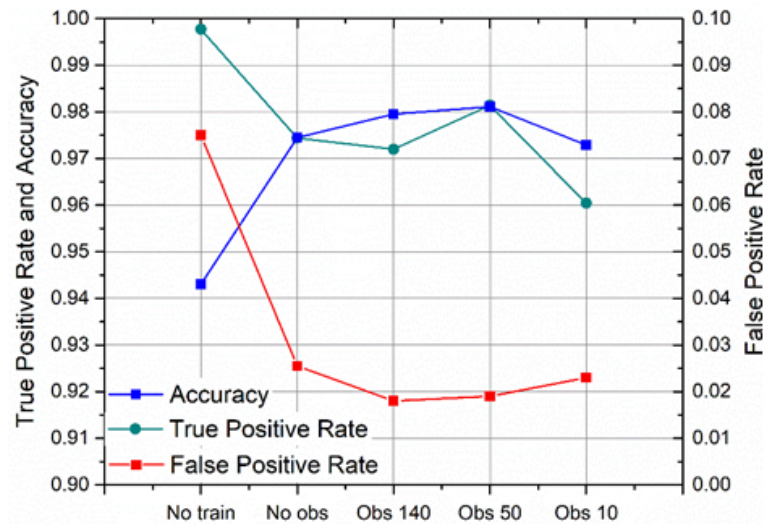

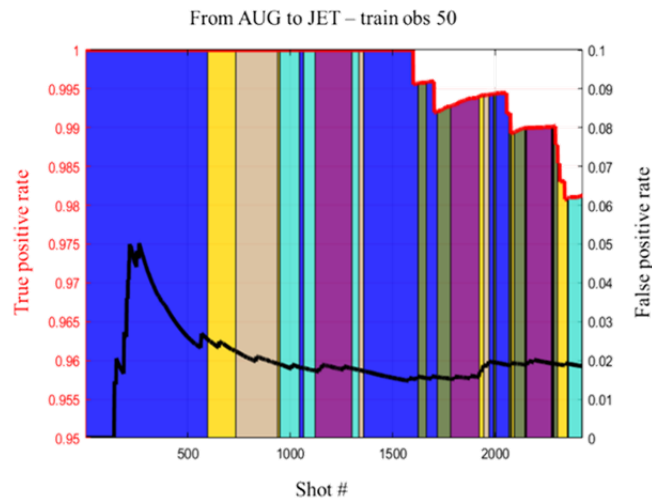

Results on ASDEX-Upgrade

AUG	Success rate	Missed	Early	Tardy	False	Mean [ms]	Std [ms]
LM _A , I _i and LM _{std} 1.5 ms	87.66% (135/154)	5.84% (9/154)	5.84% (9/154)	0.65% (1/154)	5.70% (31/538)	22.3	66.1
LM _A L LM _{std} and Bolo L/M 10 ms	90.73% (137/154)	5.84% (9/154)	3.31% (5/154)	0.00% (0/154)	8.16% (44/539)	43.1	109.7

Results on JET without any specific training

JET	Success rate	Missed	Early	Tardy	False	Mean [ms]	Std [ms]
LM _A , l _i and LM _{std} 6 ms	98.14% (421/429)	1.40% (6/429)	0% (0/429)	0.47% (2/429)	1.90% (38/1998)	278.3	390.2
LM _A , l _i , LM _{std} and Bolo L/M 1000 ms	94.17% (404/429)	1.63% (7/429)	3.73% (16/429)	0.47% (2/429)	7.69% (150/1951)		

Prediction on JET starting from a training on ASDEX-Upgrade has been tested and it has been demonstrated that acceptable prediction performances can be obtained if we use:

- Dimensionless signals;
- Adaptive approaches with transfer learning .

Moreover, predictors can be optimised to increase the warning time, but at the price of slightly lower accuracy.

Use of multiple predictors for different tasks (mitigation, prevention, and avoidance) may be a good solution, as also recently investigated by G. Rattà et al.

$$B_{LM,JET} = \sqrt{(B^{ns})^2 + (B^{ew})^2}$$

$$B_{LM,AUG} = \sqrt{(B^{ew})^2} = |B^{ew}|$$

Divertor / Core Radiation Ratio

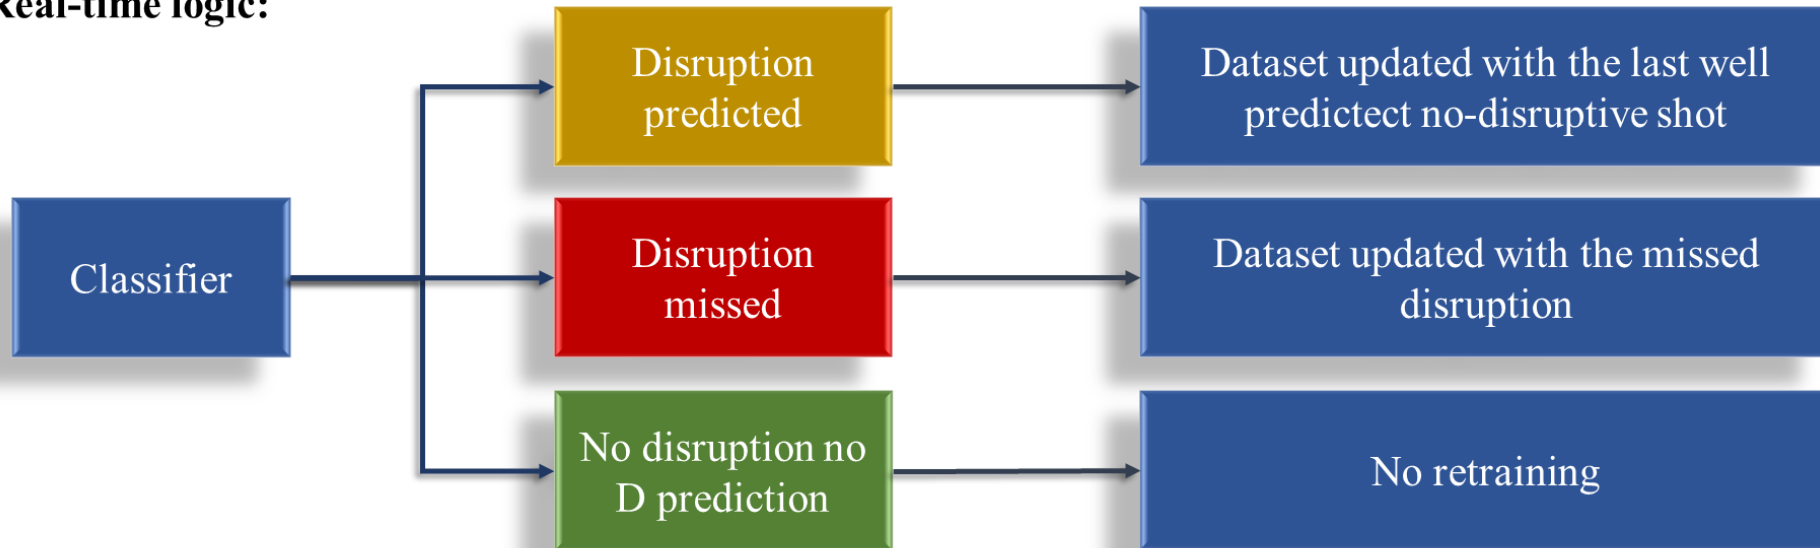

Adaptative learning

At each pulse, the dataset may be updated, and the classifiers retrained.

Real-time logic:

Adaptative de-learning

Oldest shots are removed from the datasets
