

Rodrigo Mateus is an Assistant Researcher at Instituto Superior Técnico, as member as the Materials Processing and Characterization Group of Instituto de Plasmas e Fusão Nuclear, at Campus Tecnológico e Nuclear, Bobadela, Portugal. The main work of R. Mateus is based on the study of chemical and structural modifications induced to Plasma facing components (PFC) and plasma facing materials (PFM), like Be-based and W-based materials co-deposited with 2H , He, C, N, O and Ne or irradiated with 2H and He plasmas, or liquid metals as Sn and Li-Sn under plasma irradiation. Gas retention and phase formation induced by annealing, by ion implantation and by plasma irradiation are the focus of the investigations, supported mainly by ion beam analytical techniques, but also by X-ray diffraction and electron microscopy techniques.
