

Dr. Giuliana Aquilanti is the head of beamlines XAFS and XRF and coordinator of the Research Project cluster at Italian synchrotron in Trieste (Elettra). She received her PhD in Physics at the University Joseph Fourier (Grenoble, France). The research carried out over the last 20 years concerns the development and application of x-ray techniques (mainly x-ray absorption spectroscopy) for the study of matter and was carried out at the European Synchrotron in Grenoble (ESRF) and at Elettra. Her research activity is devoted to two main themes: (a) structural characterization of advanced materials for energy storage, and (b) structural characterization of matter under extreme pressure and temperature conditions. She coordinates the scientific activity of the XAFS and XRF beamlines staff, and she supervises fellows within different programs of ICTP, IAEA and IUCr. She is involved in different research projects funded by EU, IAEA and CERIC-ERIC. She is member of the XAFS commission of the IUCr. She has co-authored more than 200 scientific articles.
