

Verification and Validation Activities with OpenMC

Paul K. Romano

Computational Scientist, Argonne National Laboratory

Technical Meeting on CoNDERC

October 12, 2022

What is OpenMC?

A community developed, open source Monte Carlo particle transport code, primarily targeted at applications in nuclear science and engineering

OpenMC: Overview of features

- **Modes:** Fixed source, k -eigenvalue calculations, volume calculations, geometry plotting
- **Geometry:** Constructive solid geometry, CAD-based, unstructured meshes
- **Solvers:** Neutron and photon transport, depletion
- **Data:** Continuous energy or multigroup cross sections, multipole for Doppler broadening
- **Parallelism:** Distributed/shared-memory via MPI/OpenMP

OpenMC: Unique attributes

What sets OpenMC apart from other codes?

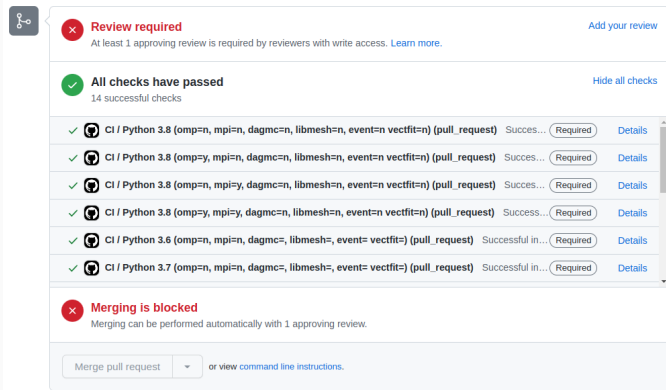

- Programming interfaces (C/C++ and Python)
- Nuclear data interfaces and representation
- Tally abstractions
- Parallel performance
- Development workflow and governance

- Code: <https://github.com/openmc-dev/openmc>
- Documentation: <https://docs.openmc.org>
- Nuclear Data: <https://openmc.org>
- Forum: <https://openmc.discourse.group>
- Slack: <https://join.slack.com/t/openmc/signup>

1. Continuous integration testing
2. Criticality benchmarks
3. Depletion comparisons
4. Shielding benchmarks
5. Automated model conversion

Continuous integration testing

Every time a pull (change) request is made, a comprehensive set of regression and unit tests are run for a matrix of build/run configurations

The screenshot displays a GitHub pull request interface. At the top left is a GitHub logo. The main content area is divided into several sections:

- Review required:** A red circle with a white 'x' icon. Text: "Review required". Subtext: "At least 1 approving review is required by reviewers with write access. [Learn more.](#)" A button "Add your review" is on the right.
- All checks have passed:** A green circle with a white checkmark icon. Text: "All checks have passed". Subtext: "14 successful checks". A button "Hide all checks" is on the right.
- Check list:** A scrollable list of six CI checks, each with a green checkmark icon, a GitHub Actions icon, and a "Details" link. The checks are:
 - CI / Python 3.8 (omp=n, mpi=n, dagmc=n, libmesh=n, event=n vectfit=n) (pull_request) Success... (Required) Details
 - CI / Python 3.8 (omp=y, mpi=n, dagmc=n, libmesh=n, event=n vectfit=n) (pull_request) Success... (Required) Details
 - CI / Python 3.8 (omp=n, mpi=y, dagmc=n, libmesh=n, event=n vectfit=n) (pull_request) Success... (Required) Details
 - CI / Python 3.8 (omp=y, mpi=y, dagmc=n, libmesh=n, event=n vectfit=n) (pull_request) Success... (Required) Details
 - CI / Python 3.6 (omp=n, mpi=n, dagmc=, libmesh=, event= vectfit=) (pull_request) Successful in... (Required) Details
 - CI / Python 3.7 (omp=n, mpi=n, dagmc=, libmesh=, event= vectfit=) (pull_request) Successful in... (Required) Details
- Merging is blocked:** A red circle with a white 'x' icon. Text: "Merging is blocked". Subtext: "Merging can be performed automatically with 1 approving review."
- Actions:** A "Merge pull request" button with a dropdown arrow, followed by the text "or view command line instructions."

Works well when no changes are expected in reference results

Changes in reference results

When a change in our reference results *are* expected (new physics, random number stream, etc.), we kick off a set of benchmark simulations to ensure everything agrees within uncertainty:

- MIT hosts a collection of [reactor physics benchmark models](#) for OpenMC, including ~400 ICSBEP models:

Fuel	COMP	MET	SOL	MISC
HEU	7	72	48	0
LEU	6	0	32	0
IEU	1	12	0	0
PU	1	39	121	0
U233	1	10	7	0
MIX	8	27	0	0

Fuel	THERM	INTER	FAST	MIXED
HEU	48	11	68	0
LEU	38	0	0	0
IEU	0	0	13	0
PU	121	2	38	0
U233	7	1	10	0
MIX	6	1	28	0

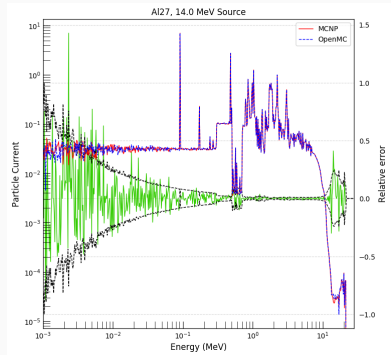

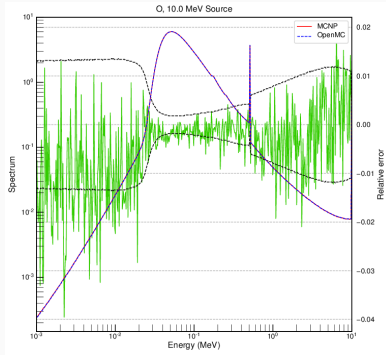

- A collection of ICSBEP/IRPhEP benchmark models were [contributed](#) to CoNDERC under the “beyond k_{eff} ” section
- Emphasis placed on utilizing additional functionality:
 - Plotting flux spectra in various materials
 - Built-in energy group structures
 - Radial flux profile in a spherical mesh
 - Automated volume/mass checks compared to benchmark specifications
 - Complex modeling functionality in OpenMC
 - Use of third-party Python packages
 - Automated generation of parameterized models

- We also maintain a repository of [validation scripts](#)
 - `openmc-run-benchmarks` — Run a collection of ICSBEP benchmarks using either OpenMC or MCNP and collect results
 - `openmc-plot-benchmarks` — Plot results from `openmc-run-benchmarks`
- Running hundreds of benchmarks is as simple as executing a single command (and having a big computer!)

Simple Physics Comparisons

Validation scripts also include simple physics comparisons:

- Neutron/photon spectrum from a monoenergetic point source in a sphere
- Secondary photon spectrum in broomstick model (coupled $n-\gamma$)

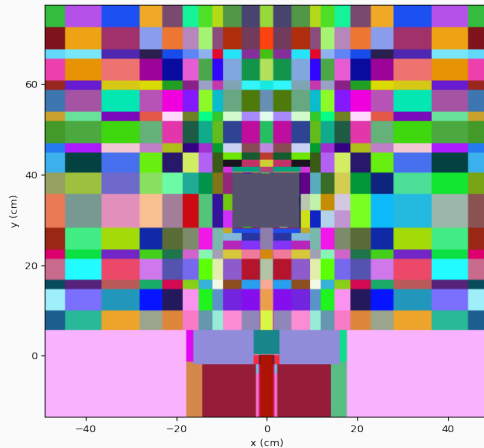

Depletion Code-to-code Comparison

Extensive code-to-code comparisons for depletion have been carried out with OpenMC and Serpent

SINBAD Benchmarks

- As part of a new project funded by DOE/Fusion Energy Sciences, OpenMC models for SINBAD benchmarks are being developed
- First one is “FNG dose”:

FNG Dose: Early Results

Automated Model Conversion

- Recently, we released a [utility for converting MCNP models](#) to OpenMC
- Unlike [csg2csg](#), directly utilizes OpenMC's Python API
- Some MCNP features are not supported:
 - Periodic boundary conditions
 - Hexagonal lattices
 - Some macrobodies
 - Source definitions, tallies, and most cards in the “data” section

Model Conversion: ITER E-lite

Model Conversion Opportunities

- General capability for model conversion opens up new opportunities:
 - Maintaining a single “canonical” set of inputs
 - Minimizing/eliminating model differences
 - Volume comparisons
 - Mass comparisons
- Many code-to-code differences (esp. outliers) I’ve seen tend to be a result of modeling errors or inconsistencies
- Study different approaches in [csg2csg](#), [t4_geom_convert](#), and [openmc_mcnp_adapter](#) to learn from one another

Thank you!

Acknowledgments

- This research was supported by the Exascale Computing Project (17-SC-20-SC), a collaborative effort of two U.S. Department of Energy organizations (Office of Science and the National Nuclear Security Administration) responsible for the planning and preparation of a capable exascale ecosystem, including software, applications, hardware, advanced system engineering, and early testbed platforms, in support of the nation's exascale computing imperative.
