

DE LA RECHERCHE À L'INDUSTRIE

BENCHMARKING OF NUCLEAR DATA FOR TRIPOLI-5

Technical Meeting on the Compilation of Nuclear Data Experiments for Radiation Characterization, AIEA | 10-14 October 2022

C. Larmier

DES/ISAS/DM2S/SERMA

Introduction

TRIPOLI-5, the new Monte Carlo code at CEA

Presentation of the benchmark

Results obtained (free gas model)

- Non equivalence of the data used by different codes

- Problems/errors in the implementation

- Consistency problems detected in nuclear data

- Free gas : summary

Additional results about thermal scattering

- Consistency problems detected in nuclear data

- Sampling of thermal reactions

- Checks on microscopic cross sections

- Flux comparisons

Conclusion

- ▶ PATMOS : new massively parallel Monte Carlo transport code developed at CEA
- ▶ Recent implementation of neutron physics
 - Free gas model
 - Thermal scattering law (TSL)
- ▶ First step of verification :
 - Code-to-code comparisons (TRIPOLI-4[®] and OpenMC)
 - Contribution to corrections/fix-ups
- ▶ Development of a test environment for :
 - All isotopes (562) from library JEFF-3.3
 - Representative energies of the neutron spectrum in a reactor

Introduction

TRIPOLI-5, the new Monte Carlo code at CEA

Presentation of the benchmark

Results obtained (free gas model)

- Non equivalence of the data used by different codes

- Problems/errors in the implementation

- Consistency problems detected in nuclear data

- Free gas : summary

Additional results about thermal scattering

- Consistency problems detected in nuclear data

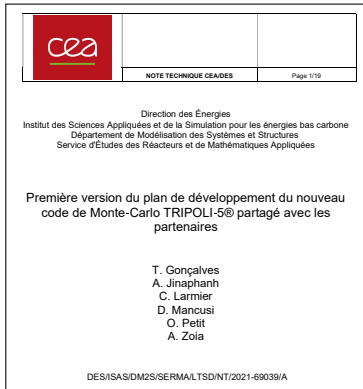

- Sampling of thermal reactions

- Checks on microscopic cross sections

- Flux comparisons

Conclusion

- ▶ started in **January 2022**
- ▶ co-financed by CEA/EDF/Framatome/IRSN
- ▶ **co-developed** by CEA/IRSN
- ▶ builds on **PATMOS**

E. Brun, S. Chauveau, F. Malvagi, PATMOS : A prototype Monte Carlo transport code to test high performance architectures, in Proc. MC 2017, Jeju, Korea, April 16-20 (2017)

A testing framework for ...

- ▶ code **architecture**
 - **multi-level** parallelism
- ▶ **coupling**
- ▶ new **technologies**
 - GPGPU
 - vectorisation

Some collaborations

- ▶ Arm, Intel, Nvidia
- ▶ CEA/DAM, universities
- ▶ EU project **DEEP-SEA**

*Grand Challenge on Tera1000-2 : a PWR
irradiation cycle (6×10^6 regions) with **four**
levels of parallelism (10^7 CPU-hours)*

- ▶ **full-core** simulations
- ▶ **couplings**
 - thermal hydraulics
 - thermo-mechanics
 - depletion
- ▶ kinetics (neutrons/precursors)
- ▶ **large** memory footprint
 - $\sim 10^2$ isotopes
 - $\sim 10^3$ temperatures
 - ~ 1 GB per temperature
 - ~ 1 TB total
- ▶ **continuous** burn-up of material properties
 - alternative tracking methods

K. Wang et al.

Prog. Nucl. Energy 98 (2017) 301–312

D. J. Kelly et al.

Nucl. Eng. Technol. 49 (2017) 1326–1338

- ▶ **massive** parallelism
 - shared memory
 - distributed memory
 - vectorization
- ▶ computing architectures
 - **heterogeneous**
 - **quickly** evolving

Work-flow

- ▶ continuous integration
- ▶ code review
- ▶ modularity

technologies

- ▶ C++14
- ▶ OpenMP + MPI
- ▶ API Python
- ▶ *CUDA*

Introduction

TRIPOLI-5, the new Monte Carlo code at CEA

Presentation of the benchmark

Results obtained (free gas model)

- Non equivalence of the data used by different codes

- Problems/errors in the implementation

- Consistency problems detected in nuclear data

- Free gas : summary

Additional results about thermal scattering

- Consistency problems detected in nuclear data

- Sampling of thermal reactions

- Checks on microscopic cross sections

- Flux comparisons

Conclusion

► Test configuration :

- Sphere, radius $R=30$ cm
- One single isotope
- Isotropic, mono-energy, point source
- Observable : flux per unit lethargy (collision estimator)
- Number of particles : 10^6
- Density $\gamma(E) = \frac{1}{R\hat{\sigma}_{t,i}(E)}$ with $\hat{\sigma}_{t,i}(E)$ a 4-group microscopic total cross section

► Simulation parameters :

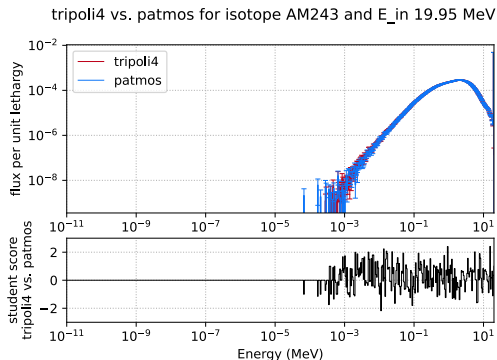

- 562 isotopes (free gas only) from nuclear data library JEFF-3.3
- Source energy E_0 (MeV) : 1e-11, 2.5e-08, 1e-06, 3e-05, 0.001, 0.03, 1.0, 14.1, 19.95

► 5058 validation configurations

► Code-to-code comparisons between 3 Monte Carlo transport codes :

- OpenMC
- TRIPOLI-4®
- PATMOS

- ▶ How to compare results for the flux between two codes ?
- ▶ The Student test can be used to estimate the consistency probability of the results for a given energy bin

- ▶ Used to solve the problem of multiple comparisons (at each energy bin)
- ▶ Calibrated with a threshold α (we choose $\alpha = 0.001$)
- ▶ We expect "false negatives" with probability α (~ 5 for 5000 configurations)

Figure 1 – Test HB : success

Figure 2 – Test HB : failure

- Initially PATMOS did not take into account some reactions

Figure 3 – Flux without MT reactions 875 - 891

Figure 4 – Flux with MT reactions 875 - 891

- ▶ For each code, we have developed dedicated routines in order to sample :

- the outgoing energy distribution $f(E'|E)$
- the outgoing cosine distribution $g(\mu|E)$

for given parameters :

- isotope/temperature
- interaction (MT)
- incoming energy E
- number of samples (10^6)

- ▶ Statistical test evaluating whether two samples stem from the same distribution or not

Figure 5 – KS test success :
 $p > 0.05$

Figure 6 – KS test failure :
 $p < 0.05$

- ▶ The test on the sampling of angle/energy distributions of outproducts enables to check the corresponding implementation

Figure 7 – Sampling of the energy distribution, ZN70 at 293K, MT 16, $E_0 = 19.95$ MeV

Figure 8 – Sampling of the cosine distribution, ZN70 at 293K, MT 16, $E_0 = 19.95$ MeV

Introduction

Free gas : summary

Additional results about thermal scattering

Consistency problems detected in nuclear data

Sampling of thermal reactions

Checks on microscopic cross sections

Flux comparisons

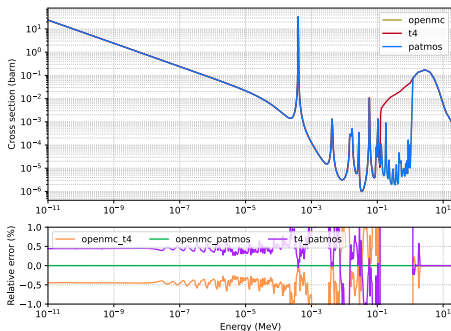

Conclusion

- ▶ For this inter-codes comparison, the data contained in different formats can differ because of the module ACER
- ▶ This makes the comparison TRIPOLI-4[®]/PATMOS harder for the analysis of discrepancies

- ▶ Full agreement on the cross section between PATMOS et OpenMC (same ACE files)
- ▶ For 22 MT reactions (over 14 isotopes), discrepancies on the cross section are observed between TRIPOLI-4[®] and PATMOS/OpenMC

Cross section reaction MT = 600 of isotope CL35

- ▶ The reconstruction of some distributions can be done by two methods :
 - parameters and analytic formula (format ENDF : TRIPOLI-4[®])
 - pre-computed numerical values (format ACE : PATMOS/OpenMC)
- ▶ Very frequent cases for all distributions involving tabulations with pdf/cdf tables
- ▶ Different size of tables between ACE and ENDF

Figure 9 – Energy distribution for N15, MT 2, $E_0 = 19,95$ MeV

Sampling of thermal reactions

Checks on microscopic cross sections

Flux comparisons

Conclusion

- ▶ Reactions identified by MT \in [51-90]
- ▶ The outgoing energy of the neutron (in CM frame) is given by :

$$E_{CM} = \frac{A+1}{A} E_{in} - C$$

- In TRIPOLI-4[®] : $C = E_{th}$ (reaction threshold)
- In PATMOS and OpenMC : $C = -Q \frac{A+1}{A}$

- ▶ In principle : $E_{th} = -Q \frac{A+1}{A}$
- ▶ However, for some isotopes : $E_{th} > -Q \frac{A+1}{A}$
- ▶ In JEFF-3.3 (T=293 K) :
 - 30 reactions
 - 18 isotopes
- ▶ A simulation option has been added to address that problem in TRIPOLI-4[®].v12

Figure 11 – Energy distribution for GD156, MT 54, $E_0 = 14.1$ MeV

Figure 12 – Corresponding flux comparison TRIPOLI-4[®]/PATMOS

Figure 13 – List of isotopes and reactions with $E_{th} \neq -Q \frac{A+1}{A}$

- ▶ Isotope CM249 at 293 K with $E_0 = 19.95$ MeV :
 - test HB KO for PATMOS/TRIPOLI-4[®]
 - test HB KO for PATMOS/OpenMC
 - test HB OK for TRIPOLI-4[®]/OpenMC

Figure 14 – Flux before correction Figure 15 – Flux after correction

- ▶ In a case where there is no delayed neutrons explicitly provided by ACE, PATMOS used ν_{prompt} instead of ν_{total}

- ▶ Isotope ZR93 at 293K with $E_0 = 14.1$ MeV :
 - test HB OK for PATMOS/TRIPOLI-4[®]
 - test HB KO for PATMOS/OpenMC
 - test HB KO for TRIPOLI-4[®]/OpenMC

patmos vs. openmc vs. tripoli4 for ZR93 (293 K) and E_in 14.1 MeV

patmos vs. openmc vs. tripoli4 for ZR93 (293 K) and E_in 14.1 MeV

Figure 16 – Flux before correction Figure 17 – Flux after correction

- ▶ For this isotope, the yield associated to MT 5 (n, other) can be equal to 0 for some incoming energies.
- ▶ It is necessary to treat the reaction as a capture instead of as a scattering.

Introduction

TRIPOLI-5, the new Monte Carlo code at CEA

Presentation of the benchmark

Results obtained (free gas model)

- Non equivalence of the data used by different codes

- Problems/errors in the implementation

- Consistency problems detected in nuclear data**

- Free gas : summary

Additional results about thermal scattering

- Consistency problems detected in nuclear data

- Sampling of thermal reactions

- Checks on microscopic cross sections

- Flux comparisons

Conclusion

"Gaps" w.r.t the energy threshold (1/2)

- ▶ Each interaction is assigned an energy threshold E_{th}
- ▶ Energy grids of the distributions of underlying outproducts start from energy E_{min}
- ▶ We expect : $E_{min} \geq E_{th}$
- ▶ However, for 6 isotopes at 293K (CR50, CR53, CR54, CS135, HF174 and HF176), there are interactions such that : $E_{min} > E_{th}$

Figure 19 – Normal case

Figure 20 – Unexpected case

Isotope	MT	Threshold energy	Minimal energy	Relative discrepancy
CR50	5	8.500000e-01	3.973966e+00	3.675254e+00
CR50	5	8.500000e-01	3.973966e+00	3.675254e+00
CR53	5	8.000000e-01	3.232537e+00	3.040671e+00
CR53	5	8.000000e-01	3.232537e+00	3.040671e+00
CR54	5	4.000000e+00	4.061986e+00	1.549650e-02
CR54	5	4.000000e+00	4.061986e+00	1.549650e-02
CS135	30	8.746430e+00	1.421000e+01	6.246629e-01
HF174	91	1.658000e-01	1.657890e+00	8.999337e+00
HF176	91	1.681930e-01	1.681930e+00	9.000000e+00

Figure 21 – List of isotopes/interactions (for JEFF-33.3, T=293K) for which the reaction threshold is smaller than the minimal energy of at least one grid of the underlying distribution (discrepancy with a relative error larger than 1%)

- ▶ PATMOS checks the consistency of nuclides when created
- ▶ From these consistency checks, we could observe small problems in ACE files from JEFF-3.3 library at 293K :
 - Some cumulative functions distributions (cdf) are not sorted in the ascending way
 - Some tables associated to pdf/cdf are not sorted in the ascending way
 - Isotopes : AG110M, CD115M, CR50, CR53, CR54, NE20, SI32
 - ACE files generated from **njoy 2016.42, at NEA on 2018-10-01**

Introduction

TRIPOLI-5, the new Monte Carlo code at CEA

Presentation of the benchmark

Results obtained (free gas model)

- Non equivalence of the data used by different codes

- Problems/errors in the implementation

- Consistency problems detected in nuclear data

- Free gas : summary**

Additional results about thermal scattering

- Consistency problems detected in nuclear data

- Sampling of thermal reactions

- Checks on microscopic cross sections

- Flux comparisons

Conclusion

Summary of the code-to-code comparison for the flux (5058 configurations) :

- ▶ PATMOS/TRIPOLI-4[®] : 91.7% of success rate (HB test)
- ▶ PATMOS/OpenMC : 99.9% of success rate (HB test), 7 failures including :
 - 6 'false negatives' (we obtain a passing HB test after modification of the seed in one code), consistent with the probability of rejection for HB test ($\alpha=0.1$)
 - 1 resolved case : ZR93 at 293K, $E_0 = 14.1$ MeV

Introduction

TRIPOLI-5, the new Monte Carlo code at CEA

Presentation of the benchmark

- Sampling of thermal reactions

- Checks on microscopic cross sections

- Flux comparisons

Conclusion

Introduction

TRIPOLI-5, the new Monte Carlo code at CEA

Presentation of the benchmark

Results obtained (free gas model)

- Non equivalence of the data used by different codes

- Problems/errors in the implementation

- Consistency problems detected in nuclear data

- Free gas : summary

Additional results about thermal scattering

- Consistency problems detected in nuclear data**

- Sampling of thermal reactions

- Checks on microscopic cross sections

- Flux comparisons

Conclusion

- ▶ A problem **systematically** present in ACE files is $\text{cdf}[0]$ not being equal to 0 for each energy sub-distributions of (continuous) inelastic reactions
- ▶ $\text{cdf}[0]$ around $1\text{e-}16$ - $1\text{e-}5$ for NJOY
- ▶ $\text{cdf}[0]$ around $1\text{e-}8$ for FRENDY
- ▶ Some negative energies can be produced because of that problem within the sampler (with both OpenMC and PATMOS) with a small probability
- ▶ We chose to complete the distribution on the left, by adding $\text{cdf}[0]=0$, $\text{pdf}[0]=0$, energy value $E[0]=0$ (see Eq.(1)) and a "isotropic"-like table for discrete angles
- ▶ This post-treatment is almost invisible with respect to OpenMC apart from in one case (MG in metal) detailed further...

$$\sigma(E \rightarrow E', \mu, T) = \frac{\sigma_b}{2kT} \sqrt{\frac{E}{E'}} \exp\left(-\frac{\beta}{2}\right) S(\alpha, \beta, T) \quad (1)$$

- ▶ **All cumulative density functions involved in inelastic reactions** have one negative value (absolute value close to 10^{-16})
- ▶ Necessity to set the negative values to 0 in order to be able to generate binaries with PATMOS (because of our consistency checks)
- ▶ Non-sorted equiprobables/skewed tables, etc.
- ▶ We can sort them but does that make sense for skewed distributions ?

Introduction

TRIPOLI-5, the new Monte Carlo code at CEA

Presentation of the benchmark

Results obtained (free gas model)

- Non equivalence of the data used by different codes

- Problems/errors in the implementation

- Consistency problems detected in nuclear data

- Free gas : summary

Additional results about thermal scattering

- Consistency problems detected in nuclear data

Sampling of thermal reactions

- Checks on microscopic cross sections

- Flux comparisons

Conclusion

- ▶ Perfect agreement OpenMC/PATMOS for all distributions (apart from one single case : energy distribution of the inelastic reaction of MG24 in metal at 20K)

Reaction MT = C_elastic of isotope C_GRAPHITE (T = 293K) for $E_{in} = 1e-7$
 $p = 0.425259$

Figure 22 – Cosine distribution for C in graphite, $E_0 = 0.1$ eV, coherent elastic reaction

Reaction MT = I_elastic of isotope CA40_CAH2 (T = 600K) for $E_{in} = 1e-6$
 $p = 0.548795$

Figure 23 – Angle distribution for CA40 in CAH2, $E_0 = 0.1$ eV, inelastic reaction

- ▶ Energy distribution for the inelastic reaction of MG24 in metal at 20 K :
 - agreement PATMOS/OpenMC **before** the retreatment for $\text{cdf}[0]=0$: OK
 - agreement PATMOS/OpenMC **after** the retreatment for $\text{cdf}[0]=0$: KO

Figure 24 – Before retreatment in PATMOS

Figure 25 – After retreatment in PATMOS

- ▶ Looking at the "guilty" probability density function, we observe that the behaviour of this quantity looks pathological (decreasing slope at low energy)
- ▶ With such non-physical data, our work-around for the case $\text{cdf}[0]=0$ leads to significantly different results w.r.t OpenMC

Figure 26 – PDF before retreatment in PATMOS

Figure 27 – PDF after retreatment in PATMOS

- ▶ Unperfect agreement TRIPOLI-4[®]/PATMOS for some distributions
- ▶ Several explanations :
 - inelastic reactions : different size of values/pdf/cdf for energy distributions in continuous mode
 - incoherent elastic reactions : different sampling (see next slides)

Figure 28 – AL27 in AL2O3 at 293K, $E_0 = 1eV$, inelastic reaction

Figure 29 – AL27 in AL2O3 at 293K, $E_0 = 1eV$, incoherent elastic reaction

► Two ways to sample the cosine :

- TRIPOLI-4[®] uses the analytic formula $\mu = 1 + \frac{\log(\xi + (1-\xi)e^{-4EW'})}{2EW'}$
- PATMOS uses tables (OpenMC can do both methods)

Figure 30 – PATMOS uses ACE data

Figure 31 – PATMOS uses Debye-Waller factor from ENDF files

- ▶ No impact of the sampling of the incoherent elastic reaction on the flux for H1 in ZRH at 293K : the discrepancy stems probably from another distribution (probably in inelastic reaction)

Figure 32 – PATMOS uses ACE data

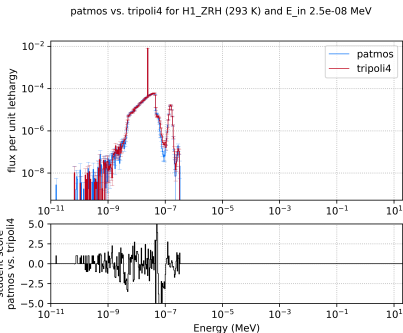

Figure 33 – PATMOS uses Debye-Waller factor from ENDF files

Introduction

TRIPOLI-5, the new Monte Carlo code at CEA

Presentation of the benchmark

Results obtained (free gas model)

- Non equivalence of the data used by different codes

- Problems/errors in the implementation

- Consistency problems detected in nuclear data

- Free gas : summary

Additional results about thermal scattering

- Consistency problems detected in nuclear data

- Sampling of thermal reactions

- Checks on microscopic cross sections**

- Flux comparisons

Conclusion

- ▶ Total cross sections do not match between TRIPOLI-4[®] and PATMOS/OpenMC for some isotopes (namely H1 in ZRH at 293K)
- ▶ There is a problem with the NATOM parameter in thermal ACE files produced by AEN (available on the website)
- ▶ Works only for H1 in H2O or similar stoichiometry

Figure 34 – Thermal ACE file from AEN

Figure 35 – PATMOS uses re-processed thermal ACE

- Focus on the inelastic reaction : factor of 2 between associated cross section read by PATMOS/OpenmC and by TRIPOLI-4[®]

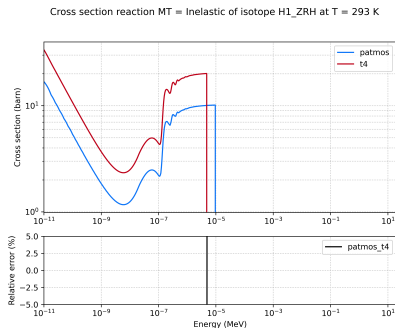

Figure 36 – Thermal ACE file from AEN

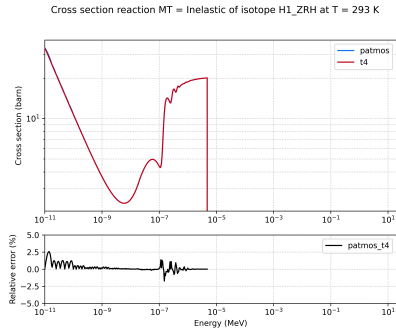

Figure 37 – PATMOS uses re-processed thermal ACE

- Focus on the incoherent elastic reaction : factor of 2 between associated cross section read by PATMOS/OpenmC and by TRIPOLI-4[®]

Figure 38 – Thermal ACE file from AEN

Figure 39 – PATMOS uses re-processed thermal ACE

- Impact on the flux : huge discrepancy between TRIPOLI-4[®] and PATMOS/OpenMC

patmos vs. tripoli4 for isotope H1_ZRH (293 K) and E_in 14.1 MeV

Figure 40 – Thermal ACE file from AEN

patmos vs. tripoli4 for isotope H1_ZRH (293 K) and E_in 14.1 MeV

Figure 41 – PATMOS uses re-processed thermal ACE

- Some discrepancies stem from the TSL threshold that differ from a code to another one

Cross section reaction MT = Total of isotope AL27_AL2O3 at T = 293 K

Figure 42 – ACE data with a threshold at 9.86 eV

Cross section reaction MT = Total of isotope AL27_AL2O3 at T = 293 K

Figure 43 – ACE data with a threshold at 4.95 eV

- ▶ For some isotopes, the size of the energy grid is significantly reduced (factor around 2-3) from ENDF files to corresponding ACE files
- ▶ This can lead to relative errors around 2.5% on interpolated cross sections for H1 in H2O at 293K at low energy.

Figure 44 – Interpolated total cross section for H1 in H2O

Figure 45 – Inelastic cross sections (points of the energy grid only)

Introduction

TRIPOLI-5, the new Monte Carlo code at CEA

- Problems/errors in the implementation

- Consistency problems detected in nuclear data

- Free gas : summary

Additional results about thermal scattering

- Consistency problems detected in nuclear data

- Sampling of thermal reactions

- Checks on microscopic cross sections

- Flux comparisons**

Conclusion

- ▶ We performed the comparison over about 217 configurations (configuration = isotope, temperature, energy of the source)
- ▶ HB test success rate : 100%

patmos vs. openmc for isotope H1_H2O (293 K) and E_in 2e-11 MeV

Figure 46 – H1 in H2O at 293K,
 $E_0 = 2e-11$ MeV

patmos vs. openmc for isotope C_GRAPHITE (293 K) and E_in 2.5e-08 MeV

Figure 47 – C in graphite at 293K,
 $E_0 = 2.5e-08$ MeV

- ▶ We performed the comparison over about 217 configurations (configuration = isotope, temperature, energy of the source)
- ▶ HB test success rate : $\sim 70\%$

patmos vs. tripoli4 for isotope H1_H2O (293 K) and E_in 2e-11 MeV

Figure 48 – Interpolated total cross section for H1 in H2O

patmos vs. tripoli4 for C_GRAPHITE (293 K) and E_in 2.5e-08 MeV

Figure 49 – Inelastic cross sections (points of the energy grid only)

Introduction

TRIPOLI-5, the new Monte Carlo code at CEA

Presentation of the benchmark

Results obtained (free gas model)

- Non equivalence of the data used by different codes

- Problems/errors in the implementation

- Consistency problems detected in nuclear data

- Free gas : summary

Additional results about thermal scattering

- Consistency problems detected in nuclear data

- Sampling of thermal reactions

- Checks on microscopic cross sections

- Flux comparisons

Conclusion

- ▶ Implementation of a routine to verify neutron physics implemented in PATMOS
 - Comparison of the flux spectrum with TRIPOLI-4[®] / OpenMC
 - Free gas model (without URR) : more than 5000 validation configurations from library JEFF-3.3
 - Thermal scattering : around 200 validation configurations from library JEFF-3.3
- ▶ Final success rate of the code-to-code comparison :
 - Free gas :
 - PATMOS / TRIPOLI-4[®] : 91.7%
 - PATMOS / OpenMC : 99.9% (6 'false negative' cases + 1 resolved case)
 - $S(\alpha, \beta)$:
 - PATMOS / TRIPOLI-4[®] : $\sim 70\%$
 - PATMOS / OpenMC : 100%
- ▶ PATMOS is in excellent agreement with OpenMC, 2 discrepancies only :
 - ZR93 at 293K, due to MT 5 and yield 0
 - MG24 in metal at 20K, due to a problem in nuclear data for the inelastic reaction (discrepancy is spotted only from the sampling of cosine distributions)

The logo for the Commissariat à l'énergie atomique et aux énergies alternatives (CEA). It features the lowercase letters 'cea' in a white, rounded, sans-serif font. A horizontal green line is positioned directly below the letters. The logo is centered within a dark red square that has a thin white border. The background of the entire slide is a red-to-white gradient with a pattern of semi-transparent circles of varying sizes, creating a halftone effect.
