

Current FENDL Activities at the University of Wisconsin-Madison

Tim Bohm

University of Wisconsin-Madison, *tim.bohm@wisc.edu*

FENDL Consultants Meeting 30 October-2 November, 2023 Vienna, Austria (hybrid)

Bohm

1

Outline

- 1) Impact of INDEN Fe-56 XS in ITER 1-D
- 2) Impact of INDEN Fe-56 XS in FNSF 1-D
- 3) Impact of INDEN F-19 XS in flibe blanket 1-D
- 4) WW generation to speed 1-D calculational benchmarks
- 5) Future Work

Goal of this work

standard MCNP id

- Look at the neutronics impact of using the updated neutron libraries in a realistic model of fusion systems using MCNP
- Libraries examined:
 - <u>Neutron:</u>
 - 1. FENDL-2.1 (21c)
 - 2. FENDL-3.1d (31c)
 - 3. FENDL-3.2b (32c)
 - 4. ENDF/B-VIII.0 (00c)
 - 5. New INDEN evaluations for Fe-56, F-19 ←
 - Photon:
 - 1. mcplib84 (84p)**

Previous work has shown that mcplib84 produces results similar to the newer MCNP eprdata12 library, the latest MCNP photon library (eprdata14) has not been tested yet

New work

Bohm FENDL Meeting 2023

ITER 1-D Cylindrical Calculation Benchmark

- Based on an early ITER design
 Developed for the FENDL evaluation process
- Simple but realistic model of ITER with the Inboard and Outboard portions modeled with the plasma in between
- D-T fusion (14.1 MeV neutrons)
- Flux (neutron and photon), heating, dpa, and gas production calculated

M. Sawan, FENDL Neutronics Benchmark: Specifications for the calculational and shielding benchmark, INDC(NDS)-316, December 1994

ITER 1-D Cylindrical Benchmark continued

WISCONSIN

Preliminary Results: Neutron Flux ITER

• FENDL-3.2b and FENDL-3.2b+fe56e80X29r67 quite close

Preliminary Results: Total Nuclear Heating ITER

FENDL-3.2b and FENDL-3.2b+f56e80X29r67 quite close

FNSF 1-D Cylindrical Computational Benchmark

Fusion Energy Systems Studies Fusion Nuclear Science Facility (FESS-FNSF)
 Breeding Zone: He cooled steel structure (90 w/o Fe, 7.5 w/o Cr, 2 w/o W, 0.2 w/o V),
 PbLi breeder (Dual Coolant Lithium Lead-DCLL)

- Includes SiC flow channel inserts in breeding zone
- Includes face plates and filler for SR, VV, LTshield
- Includes IB, OB magnet and cryostat
- MCNP materials created with PyNE
 - T. Bohm et al. "Initial Neutronics Investigation of a Liquid Metal Plasma Facing Fusion Nuclear Science Facility, *Fusion Science and Technology*, 2019.

Preliminary Results: Neutron Flux FNSF

• FENDL-3.2b vs. FENDL-3.2b+fe56e80X29r67 generally good agreement *except* deviation at OB LTshield

OB LTshield uses water cooled borated steel filler

Preliminary Results: Total Nuclear Heating FNSF

Max. relative error IB CC, WP 3-5%

Max. relative error OB CC, WP 1-2%

- FENDL-3.2b vs. FENDL-3.2b+fe56e80X29r67 generally good agreement in heating
- Not seeing deviation at OB LTshield as observed with neutron flux
 - need to refine statistics at deep locations
- Generally good agreement observed for TBR, dpa, and helium production

1-D Cylindrical Computational Benchmark (flibe blanket)

- \blacktriangleright Molten salt 2(LiF)-1(BeF₂) sometimes proposed as a liquid blanket Commonwealth Fusion Systems reactor design
- INDEN provides a new XS for ¹⁹F: https://www-nds.iaea.org/INDEN/
- Created 1-D model based on FESS-FNSF but modified the blanket:
 - Breeding Zone: 2 cm Be multiplier layer, flibe breeder tank

Results: Neutron Flux (impact of INDEN ¹⁹F XS)

Max. relative error <0.6% except CC <2.5% and WP 3.6%

- Neutron flux: higher neutron fluxes behind the flibe breeder regions
 - > 10-20% higher flux behind the IB flibe breeder zone
 - > 20-70% higher flux behind the OB flibe breeder zone

Possible Impact on Reactor Design: (due to change in ¹⁹F XS in flibe blanket)

- For this 1-D model, the e-fold attenuation distance for neutron flux in the SR shield (MF82H face plates + He cooled WC filler) was 14 cm
 Added shielding required to compensate for f19j4HE_zc:
 - IB: 3 cm
 - OB: 17 cm

Note: a candidate Commonwealth Fusion Systems flibe immersion blanket design has ~25 cm thick IB blanket and 110 cm thick OB blanket

Region	FENDL-3.2b	FENDL-3.2b +INDEN f19j4HE_zc	Ratio	FENDL-3.2b +INDEN f19e80_zt9	Ratio
IB	0.39594	0.39861	1.007	0.39769	1.004
OB	0.90622	0.92137	1.017	0.91543	1.010
Total	1.3022	1.3200	1.014	1.31312	1.008
			/		リー _ ノ

• Total TBR:

- increases by 1.4% for f19j4HE_zc in flibe blanket
- increases by 0.8% for f19e80_zt9 in flibe blanket
- while small, this is good for reactor design since flibe designs tend to need more margin to be tritium self-sufficient

Other work on 1-D Benchmark Models: Variance Reduction

FNSF 1-D

The cylindrical 1-D models are more computationally efficient than the detailed 3-D CAD models but can be improved using

variance reduction:

Weight windows are a good option:

FNSF 3-D CAD

- but potentially need many sets of WWs since many different neutronics responses of interest (thresholds at different energies, neutrons & photons)
- WW Generation options (for global VR):
 - 1. ADVANTG (FW-CADIS)
 - rigorous method uses discrete ordinates transport (forward and adjoint)
 - requires additional code package
 - 2. MAGIC
 - uses MC responses (flux) from previous run to "guess" WWs (essentially splitting to keep the particle population up through highly attenuating regions)
 - generally a few iterations needed
 - no additional code package needed

WW Generation: start simple

Results:

- Neutrons tracks now easily making it to deep regions in model
- Many more tallies pass the 10 statistical checks (for the same nps value)
- The FOM is much higher for neutron responses in deep locations:
 - Cu dpa at IB winding pack: FOM ratio=207
 - Total neutron flux at IB coil case 2: FOM ratio=8800
- The FOM is typically a bit lower at shallow locations

WW Generation: Next Steps

• MAGIC

- Repeat with a few neutron energy groups: (e.g. Eupper=0.25, 1.25, 5, 20 MeV)
- Consider adding photon WWs
- Consider adding other tallies as "drivers"
- ADVANTG
 - use FW-CADIS

Refine WW Generation method for 1-D benchmarks

Future Work

Develop more 1-D benchmarks (e.g.):

- Updated ITER design
- EU-DEMO HCPB, WCLL
- UK-STEP
- General Atomics GAMBL (SiC, PbLi waterfall blanket)
- CFS flibe immersion blanket
- Inertial Confinement designs
- Perform Sensitivity/Uncertainty analysis of important neutronics responses for variety of 1-D models
- > Look at activation responses with various activation libraries

Questions?

This work was funded in part by the U.S. Department of Energy Office of Fusion Energy Sciences under project DE-SC 0017122.
