

❑ **Snowflake** (SF) divertor is an alternative magnetic configuration that may enable tokamak operation at lower peak heat load than a standard single-null (SN) divertor. SF has been already established on **TCV**, **DIII-D** and **NSTX**.

❑ First SF experiments performed on **EAST** in summer 2014: $I_p=250\text{kA}$, $B_T=1.8\text{T}$, $q_{95}=8$, $\kappa=1.9$, ohmic and with $\text{NBI}=0.4\text{MW}$. Analysis is still ongoing.

❑ Next experiments will be dedicated to increase the **plasma current**, **H-mode** studies, nulls points distance scan and development of ISOFLUX SF shape controller.
