Energy and Sustainable Economic Development

# Heavy liquid metal pool thermal-hydraulics: experiments, analysis, technology

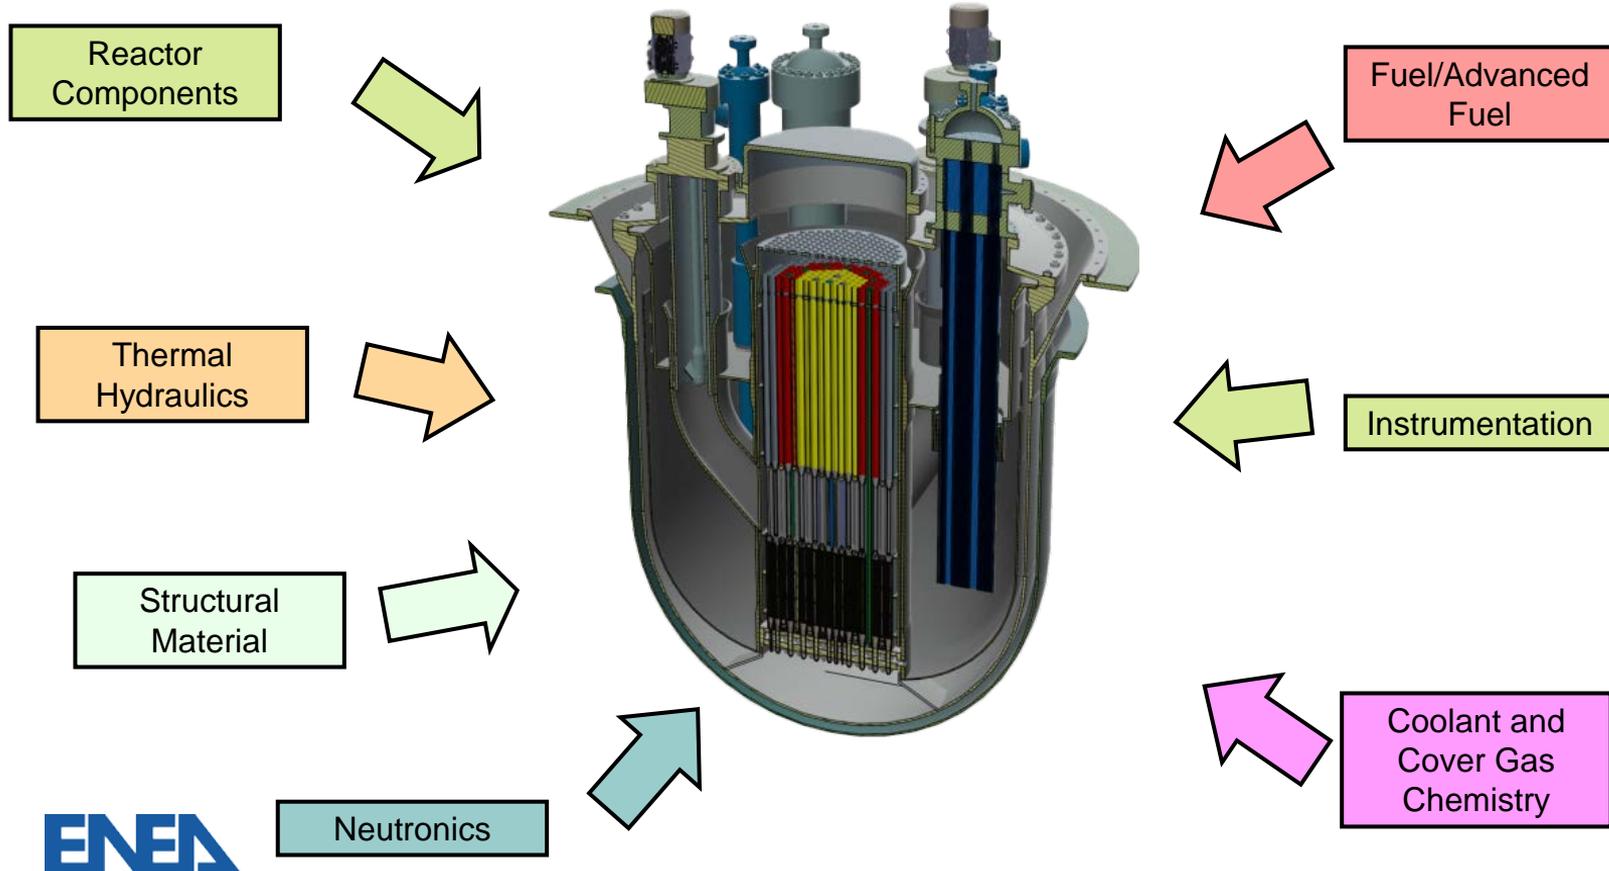

*Mariano TARANTINO*

*Bucharest, 17<sup>th</sup> February 2026*

**Nuclear Department – Nuclear Energy Systems Division**

# Motivation

# Towards the LFR Development

## Reactor Components

- ▶ **Fuel assembly** (feasibility, structural integrity, support structure from the top or from the bottom of the FA, buoyancy, failed fuel detection).
- ▶ **Fuel handling machine** (reliability, accuracy, shielding, fuel loading procedure).
- ▶ **Spent fuel element cooling system** (active and passive, reliability, behavior with blocked FA).
- ▶ **Core arrangement integrity** (core compaction prevention, radial expansion of core & feed back on reactivity).
- ▶ **Control and shut-down rods** (insertion from the top or from the bottom, reliability, actuation, speed of insertion).
- ▶ **Inner Vessel Structures** (support, replacement, resistance to lead sloshing loads).
- ▶ **Pump** (Pressure head, reliability, inertia, bearings...)
- ▶ **Steam Generator** (Design validation, material selection, component behavior in forced and natural convection, tube rupture/leakage detection, tube rupture mitigation, reliability and performance assessment, replacement).
- ▶ **Reactor vessel** (seismic assessment).
- ▶ **Decay heat removal systems** (Functional design, reliability, material selection, TH behavior)

# Towards the LFR Development

## Structural Material

- ▶ **Corrosion in Lead** (oxidation, dissolution).
- ▶ **Embrittlement in Lead** (reduction of fracture toughness and ductility, Fatigue, Creep)
- ▶ **Irradiation effects on materials in Lead** (irradiation performance of candidate materials, corrosion in Lead under irradiation, Irradiation embrittlement, irradiation creep, swelling).
- ▶ **Material for short term deployment** (austenitic steel such as AISI 316L and 15-15 Ti, DS stainless steel, ferritic martensitic such as grade 91 steels).
- ▶ **Coatings development** ( $\text{Al}_2\text{O}_3$ , FeCrAl)
- ▶ **High temperature materials for long term deployment** ( $700\text{-}800^\circ\text{C}$ , ODS steels, “MAX” phase materials).
- ▶ **Main components issues:**
  - Fuel Cladding** (irradiation effects, compatibility with coolant, material workability, component fabricability, oxide formation thickness, coating compatibility).
  - Material for pump impeller** (high relative coolant velocity).
  - SG and HX** (oxide formation thickness)
  - Reactor vessel** (long lifetime, seismic loads)
  - Seismic isolators** (qualification)

# Towards the LFR Development

## Fuel/Advanced Fuel

- ▶ **Manufacturing constrains** (Pellet specifications - density, grain size, homogeneity, porosity, pellet straightness, pellet mechanical stability, roughness - Clad specifications - wall thickness, wall thickness variation, straightness, toughness, roughness, cleanliness, corrosion resistance, heat treatment)
- ▶ **Fuel pellets** (FP release, fuel restructuring, densification and swelling)
- ▶ **Fuel cladding** (swelling, embrittlement, corrosion -coolant and fuel side-, clad-FP interaction, fatigue, creep)
- ▶ **Fuel operating conditions and failure margin assessment** (normal operation, operational transients, accidental conditions)
- ▶ **Failed fuel pin behaviour** (release of gaseous FP, dissolution of FP in the coolant, loss of fuel particles chemical reaction between fuel and coolant)
- ▶ **Corium-coolant interaction** (Fuel dispersion in coolant, chemical stability of corium)

For the existing fuel can be considered the experience gained in SFR (Phénix, Monju, Superphénix, etc.).

For the new advanced fuels (MA mixed MOX fuel, nitride fuel, carbide fuel) all aspects related to fuel need to be re-assessed.

# Towards the LFR Development

## Thermal hydraulics

- ▶ **Phenomena:**
  - HLM pool thermal-hydraulics** (flow patterns in forced convection, mixing & stratification, surface level oscillations, transition to natural circulation driven flow, natural circulation flow, etc..)
  - Water injection in lead** (SGTR accident, rupture of DHR tubes)
  - Fuel Pin - coolant interaction** (Flow induced vibrations)
  - FA blockage** (Fuel Assembly damage)
  - Gas entrainment** (two phase flow)
  - Coolant freezing** (flow blockage)
- ▶ **Modeling:**
  - System thermal-hydraulic codes** (V&V)
  - STH and neutronics** (V&V)
  - CFD and mechanical code coupling** (V&V)
  - STH code and CFD code coupling** (V&V)

# Towards the LFR Development

## Thermal hydraulics

### ▶ Experiments:

**Integral tests** (including natural circulation and decay heat removal to support the licensing process)

**Fuel bundle** (sub-channel analysis, heat transfer, cross-flow, pressure loss, etc..)

**Steam Generator** ( functional tests, SGTR accident)

**Lead pumps** (functional tests)

**FA cooling system at refueling** (performance test)

**Core cooling with total inlet flow blockage** (SGs or downcomer frozen)

# Towards the LFR Development

## Instrumentation and chemistry control

- ▶ **Coolant control & purification** (oxygen control, oxygen sensor reliability, coolant filtering, lead purification, lead cleaning from components)
- ▶ **Cover gas control** (radiotoxicity assessment of different elements, migration flow path into cover gas, removal and gettering)
- ▶ **Temperature-level-pressure-flow-neutron flux measurements** (improvement of reliability, failure mode investigation, irradiation effects)
- ▶ **In service Inspection** (ultrasound imaging & inspection, transducers development, image reconstruction technologies, sensors for in vessel inspection, sensor for reactor vessel inspection, inspection strategies, )

# Towards the LFR Development

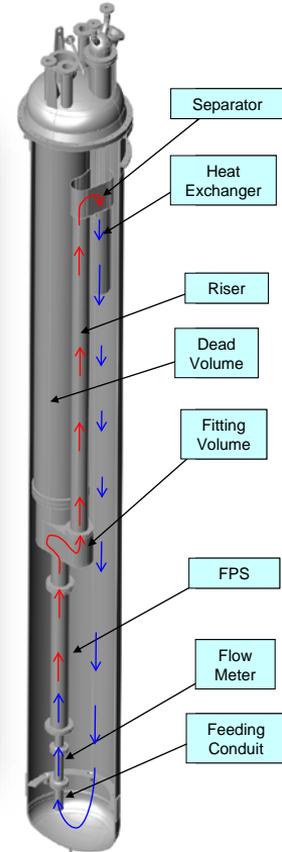

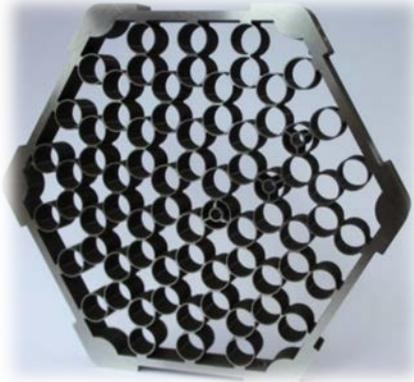

## Neutronics and reactor operation/control

- ▶ **Validation measurements for nuclear data improvement** (MA cross-sections, uncertainty reduction on cross-sections as Pb-MA- $^{241}\text{Pu}$ ,  $^{242}\text{Pu}$ , etc..).
- ▶ **Determination of flux gradients in fast spectrum.**
- ▶ **Reactivity effects** (local-coolant void reactivity worth, density coefficients, Doppler coefficient, dimension coefficients).
- ▶ **Fuel neutronic performances** (fuel utilization, spectrum evolution with burn-up, delayed neutron fraction).
- ▶ **Absorbers neutronic performances** (boron carbide, europium...)
- ▶ **Neutronic shielding** (absorbing materials, moderating materials)
- ▶ **Reactivity control** (control rods).
- ▶ **Shut down systems** (active and passive, additional protection measures).
- ▶ **Neutron code development** (Improvement & extension MCNPX, Deterministic code set-up & validation)
- ▶ **Neutron code validation experiments** (Nuclear data improvement, integral measurements & comparison with calculations)

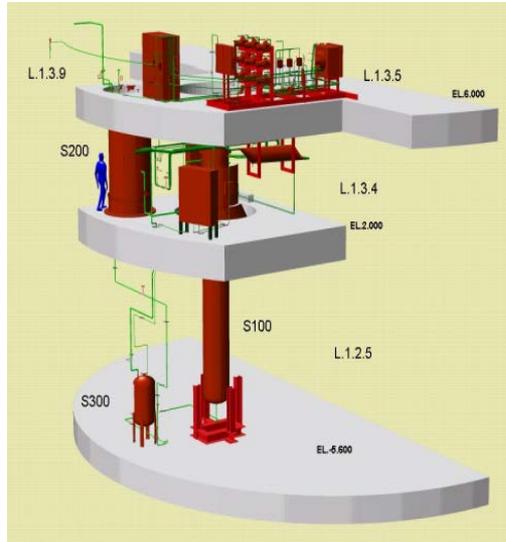

# Pool thermal hydraulic experiments

# CIRCE pool-type experimental facility

- ➔ Integral Experiments (@ 1 MW)
- ➔ OCS testing in large pool
- ➔ Component qualification
- ➔ SGTR Experiments
- ➔ SG & Pump Unit Test

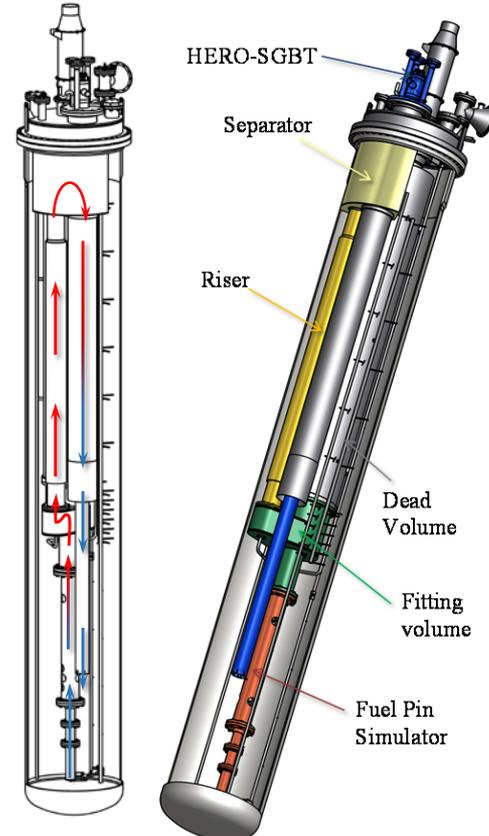

# CIRCE pool-type experimental facility

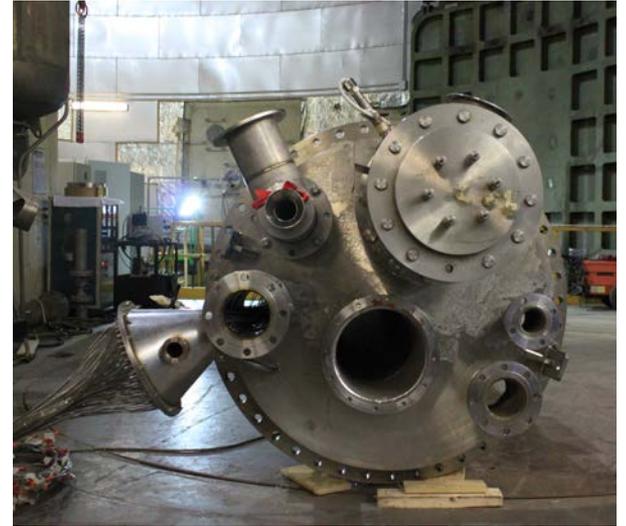

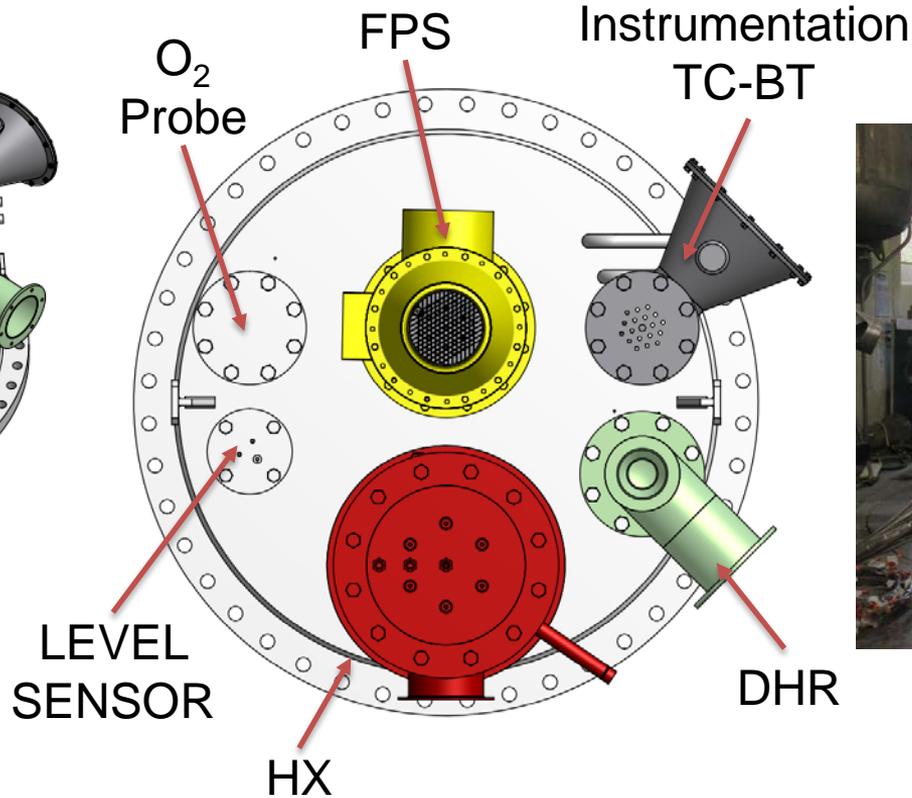

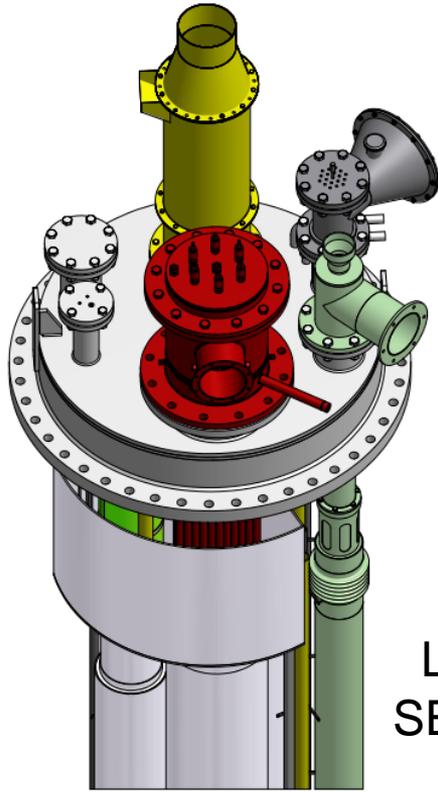

The **CIRCE facility** consists of:

- **S100** cylindrical main vessel, 8.5 m height filled with about 70 tons of Lead-Bismuth Eutectic (LBE) with argon as cover gas
- **S200** storage tank
- **S300** transfer tank

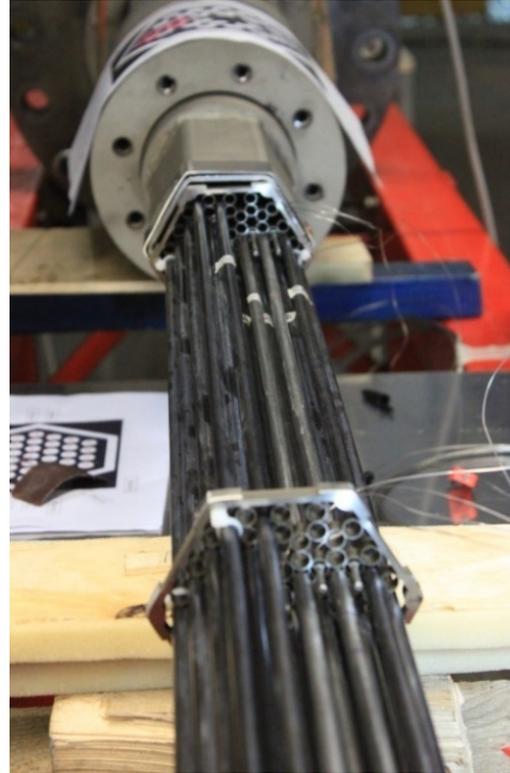

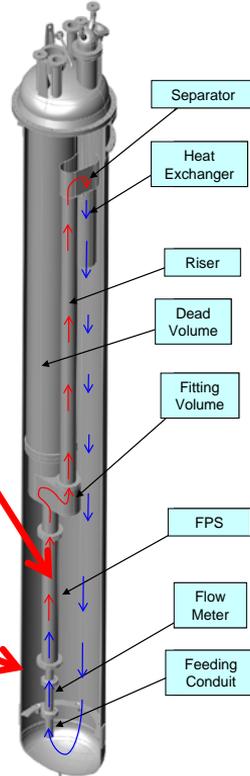

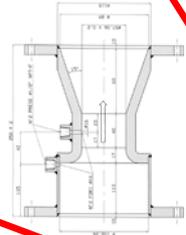

# CIRCE TS main flange

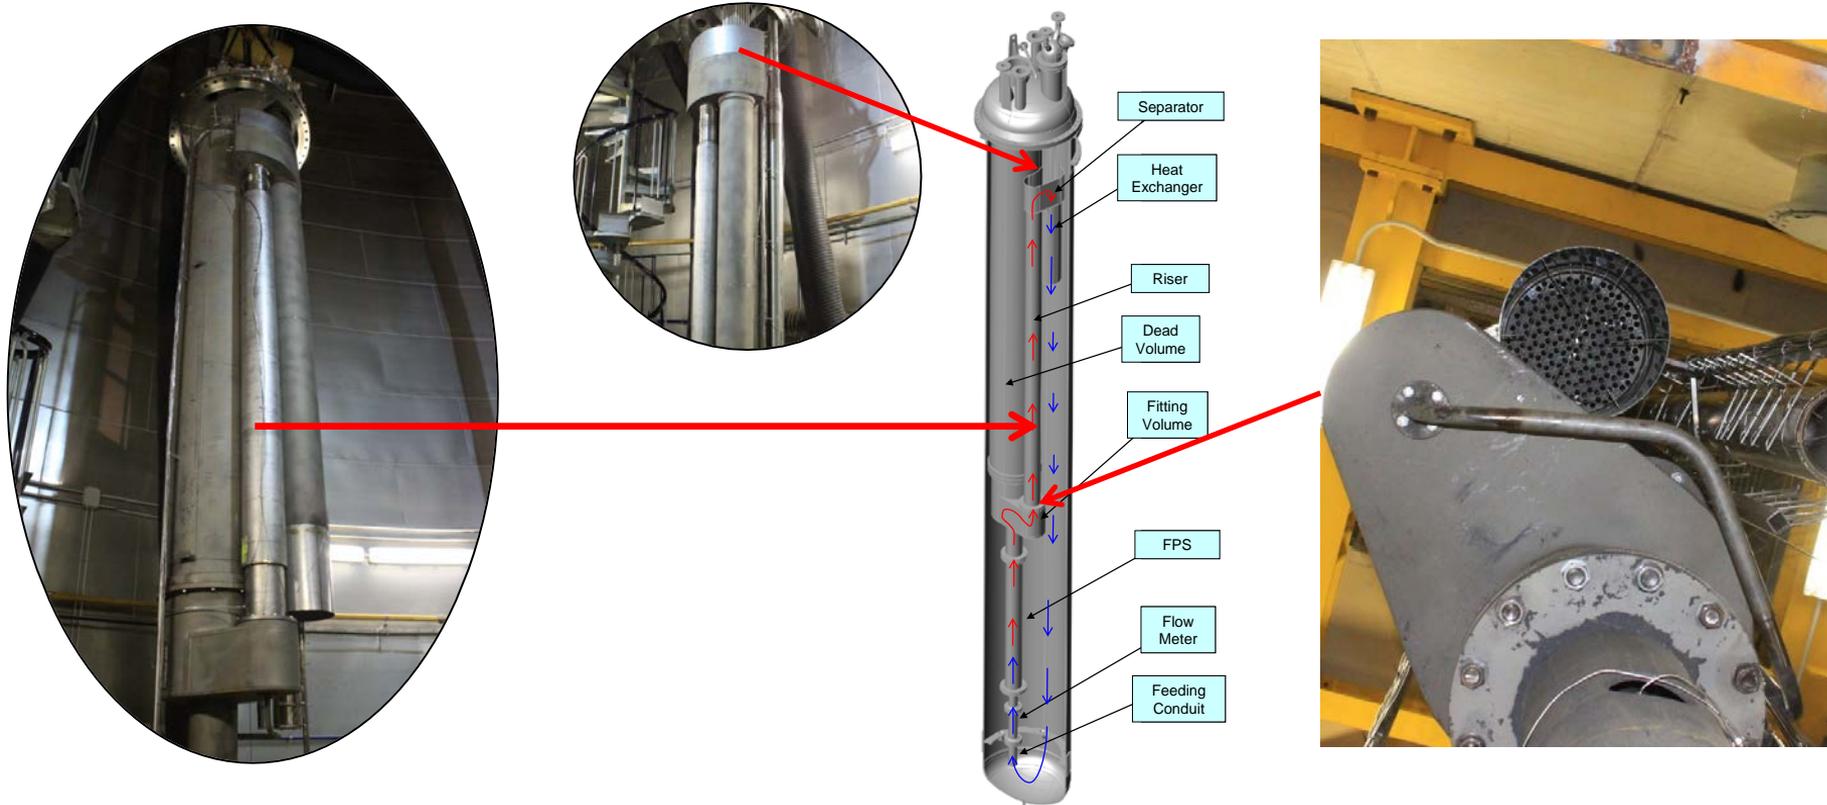

# CIRCE FPS

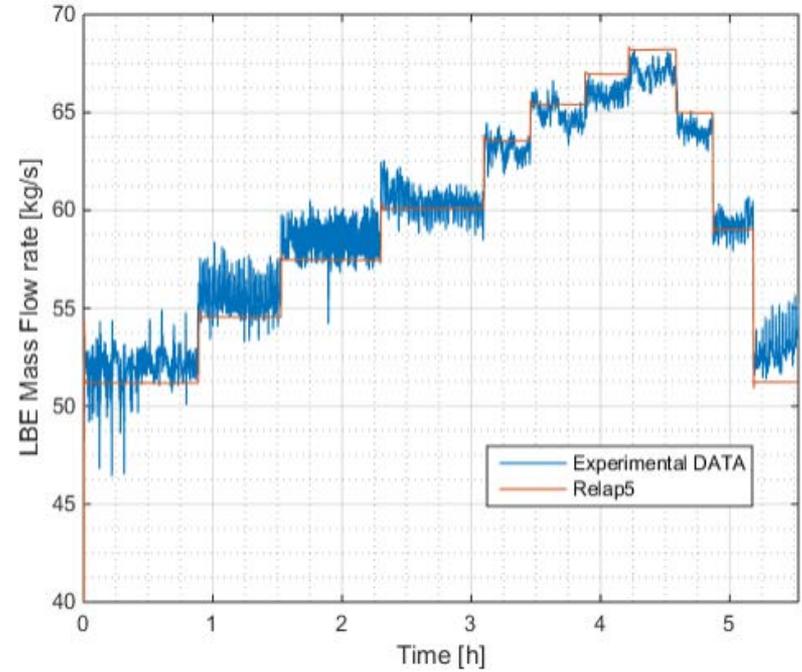

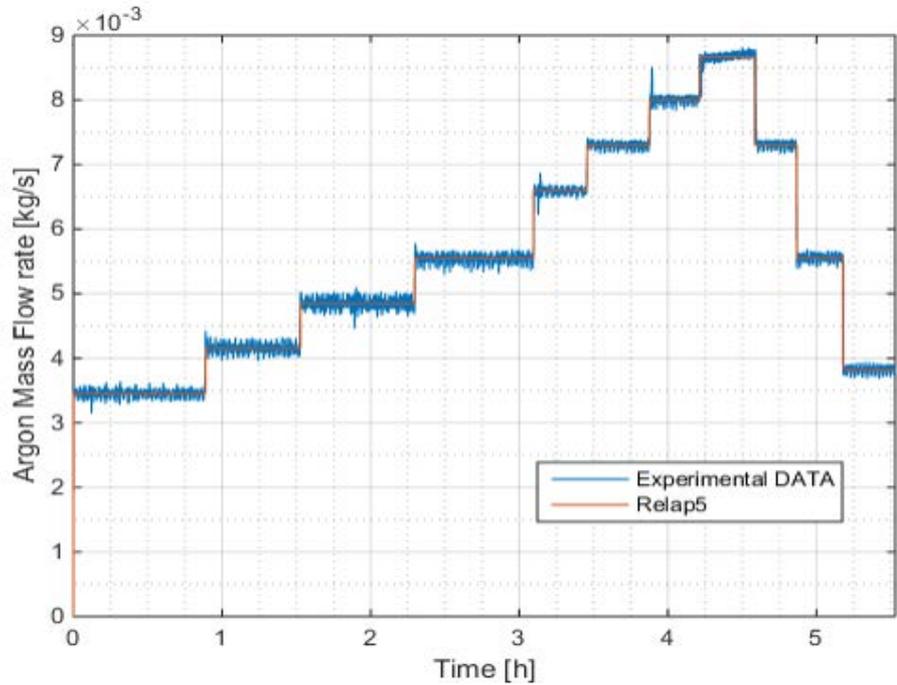

➤ Assembly:	Hexagonal
➤ $d$ :	8.2 mm
➤ $p/d$ :	1.8
➤ $L_{act}$ :	1000 mm
➤ $N_{Pin}$ :	37
➤ $q''$ :	100 W/cm <sup>2</sup>
➤ $Q_{Pin}$ :	25 kW

- Thermal Power: 925 kW
- LBE  $T_{AV}$ : 300 - 450 °C
- Core  $\Delta T$ : 100 °C
- Core velocity: 1.0 m/s
- LBE Flow Rate: 55.2 kg/s

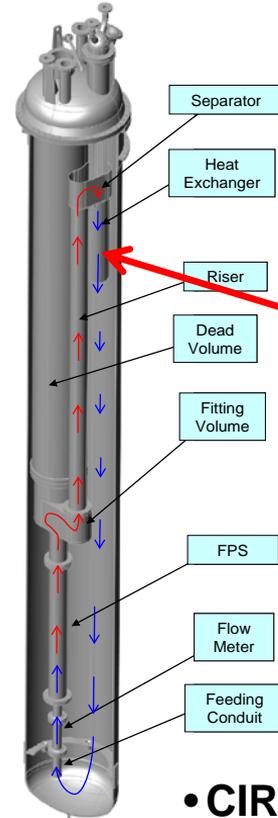

# CIRCE-ICE Configuration

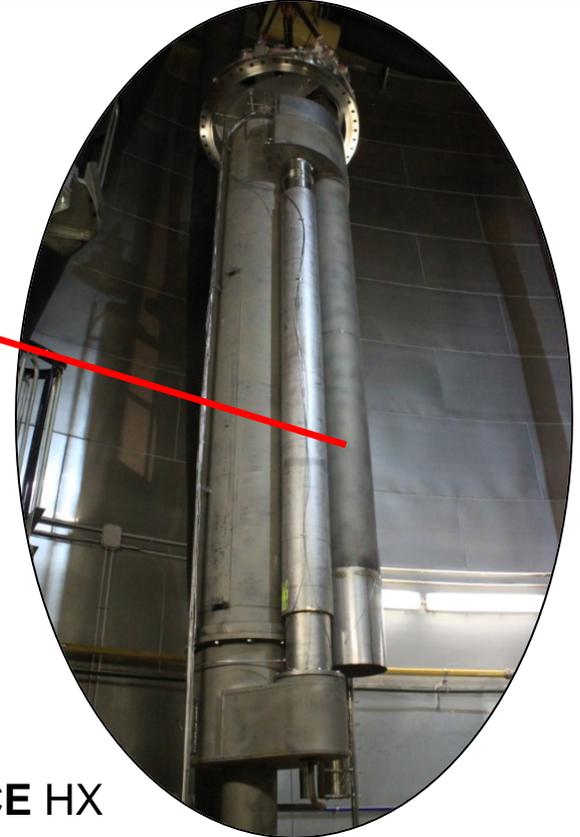

# CIRCE-ICE Configuration

# CIRCE-ICE HX

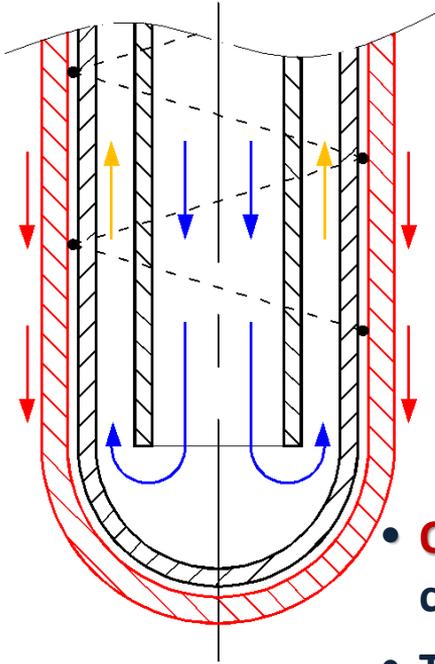

• CIRCE ICE HX

# HX Bayonet tube concept

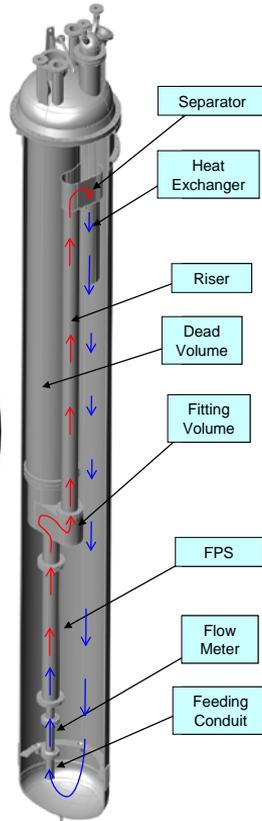

## HLM—low pressure boiling water shell heat exchanger

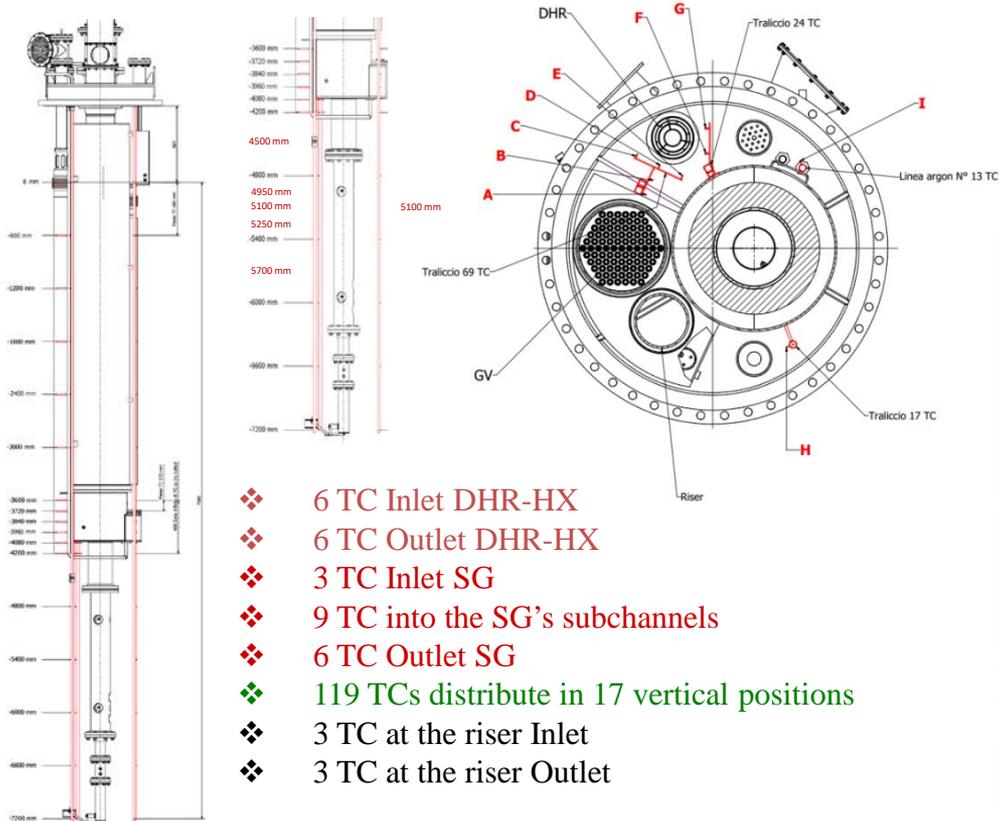

- Assembly : Triangular
- Tubes: double wall "Bayonet" with He Gap
- Material: AISI 316
- Water Pressure: 3.5 bar
- Steam Pressure : 1 bar
- Steam Quality: 0.4
- Flow Rate: 0.7 kg/s

- **Outer tubes leakage could be detected** from depressurization of the common gas plenum.
- The **two outer tubes are mechanically and thermally decoupled.**

# CIRCE-ICE DHR

# CIRCE Pool Instrumentation

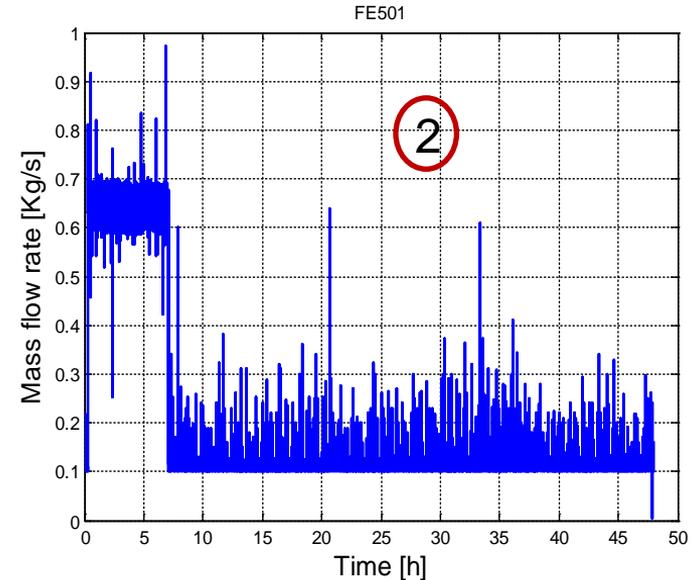

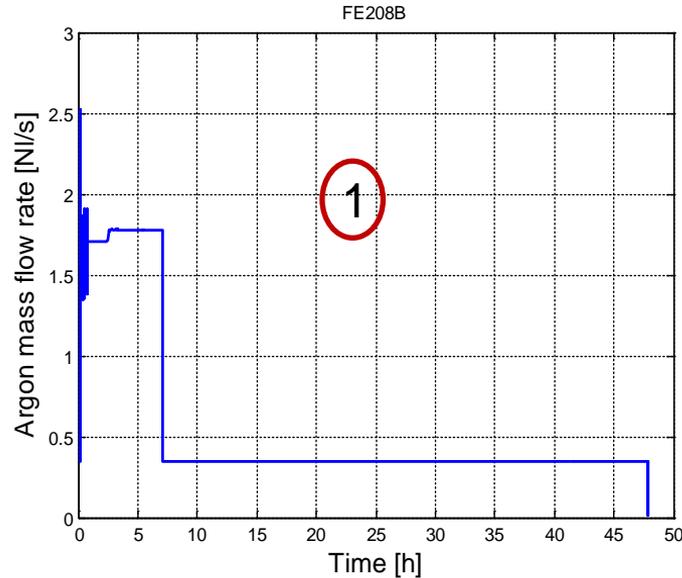

# CIRCE-ICE Experimental Campaign

- Characterize the phenomena of **mixed convection and stratification in a liquid metal pool**
- Under **nominal condition** (full power, forced circulation promoted by gas lift), a main flow path exists along the test section, which directly connects the HS with the HX.
- The **DHR** adopted **air** as secondary fluid, and it was be designed for a thermal duty of **40 kW** (about **5%** of the **nominal power**)

Transition from nominal condition to natural circulation was run **CUTTING OFF THE MAIN HX AND STARTING THE DHR HEAT EXCHANGER**, allowing to evaluate the manifestation of **secondary flow** paths, involving DHR and downcomer, uncoupled from the primary flow path.

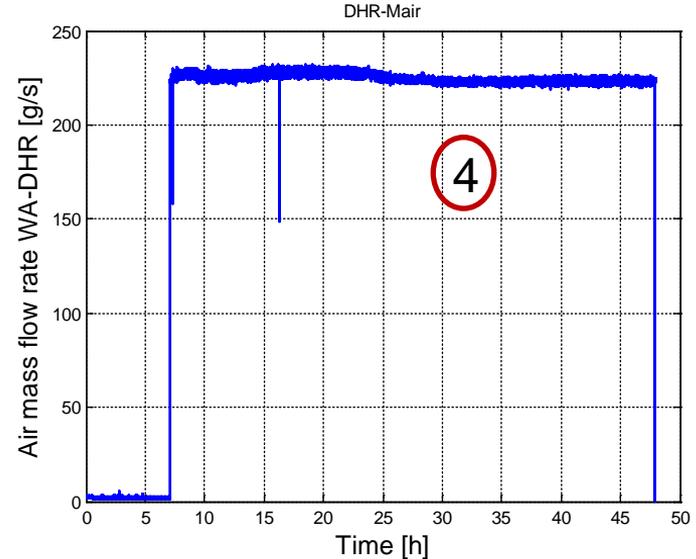

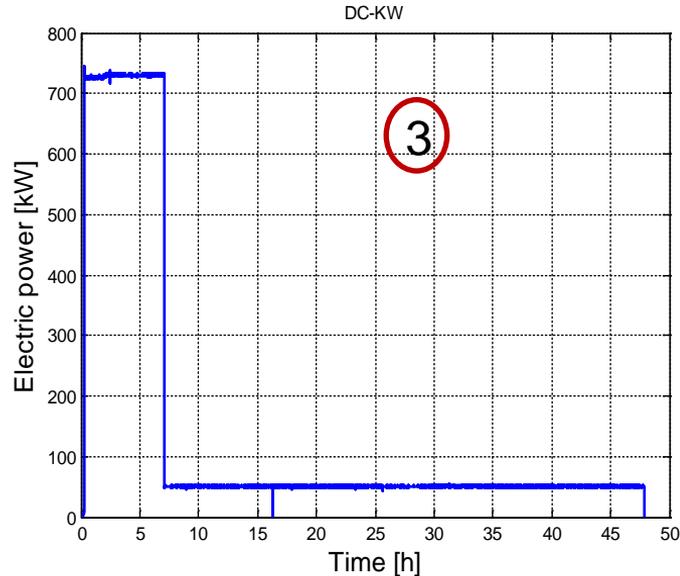

- Study **PLOHS + LOF accident (station blackout)** that in a LFR consists of:
  - ✓ Loss of all primary pumps and secondary circuits
  - ✓ Reactor scram
  - ✓ Decay heat removed in natural circulation by emergency systems (DHR-HXs).

# Experiment Description (CIRCE-ICE)

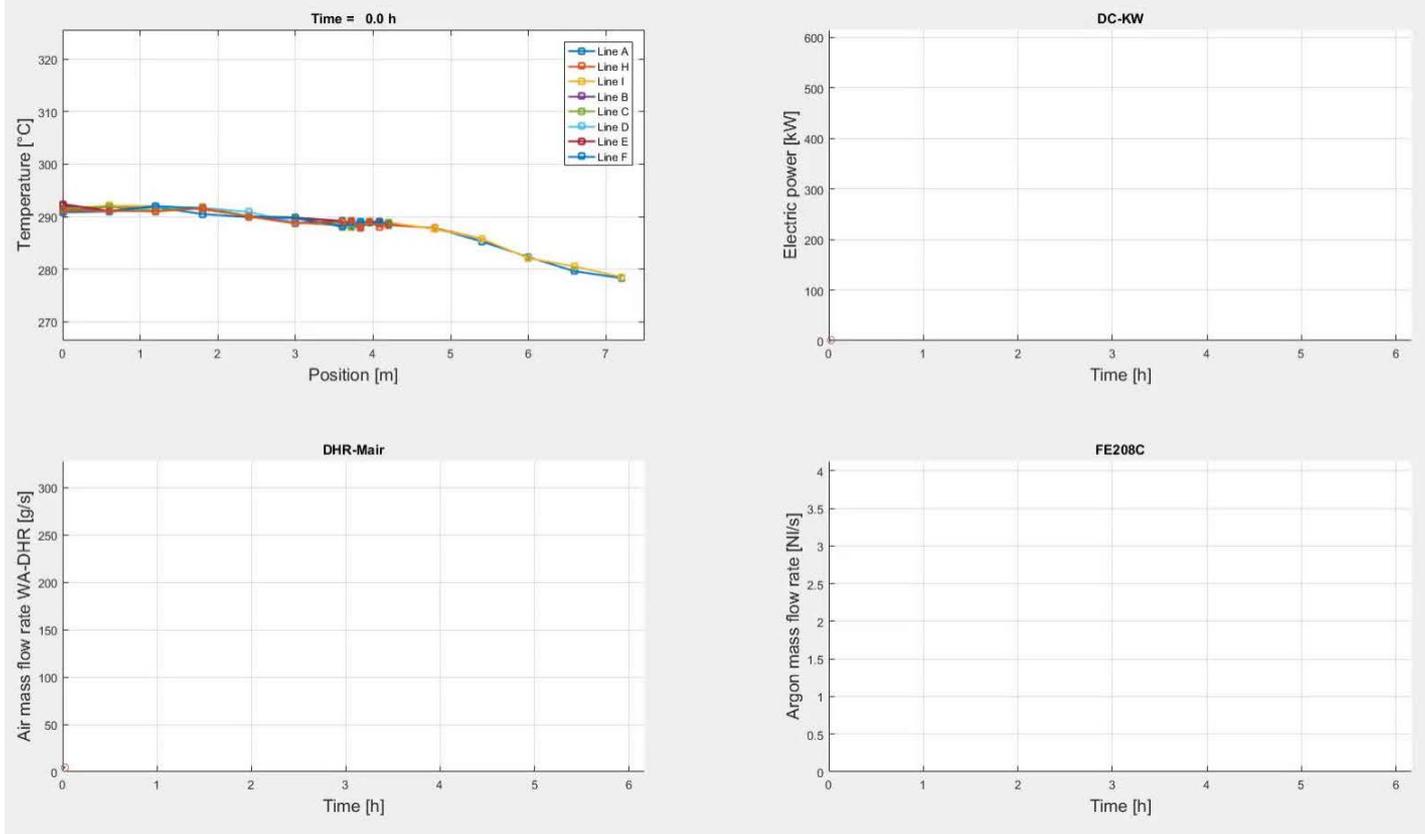

1. Loss of primary pumps → Stop Ar injection
2. Loss of primary circuit → Stop HX feedwater injection

# Experiment Description (CIRCE-ICE)

3. Reactor scram (power reduced to DH conditions) → Decreasing FPS Power
4. DHR system activation → Starting air blower

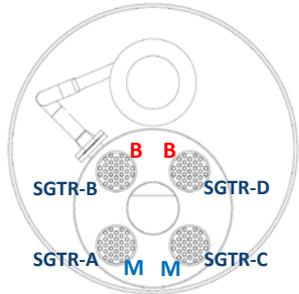

# Pool thermal Stratification

# SGTR Experiments

# SGTR Experiments in the CIRCE pool

- 4 SGTR runs (pressure wave propagation, cover gas pressurization, domino effect, vapour flow path, safety guard devices, impurities formation, LBE particulate discharge)
- 4 tube bundles (SGTR-A,-B,-C and -D) 31 tubes, full scale portions of the PHX tube bundle

**Water injection in LBE**

$T_{H_2O} = 200^{\circ}\text{C}$     $P_{H_2O} = 16 \text{ bar}$   
 $T_{LBE} = 350^{\circ}\text{C}$     $P_{COVER} = 1 \text{ bar}$

2 rupture positions **B** and **M**:  
**Bottom B** (SGTR-B and -D)  
**Middle M** (SGTR-A and -C)

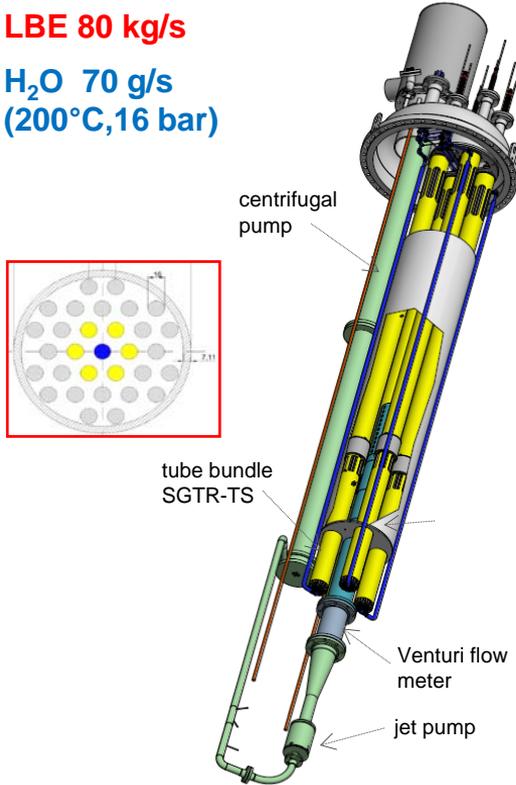

Highly instrumented TS:

- 200 TCs (45 in each SGTR-x, ) (50 Hz)
- H<sub>2</sub>O ultrasonic flowmeter (15 Hz)
- H<sub>2</sub>O level meter (1 Hz)
- 8 fast pressure transmitters (1 kHz)
- 12 bubble tubes (1 Hz / kHz)
- 30 strain gages (10 kHz)
- 2 LBE Venturi flow meters (1 Hz)

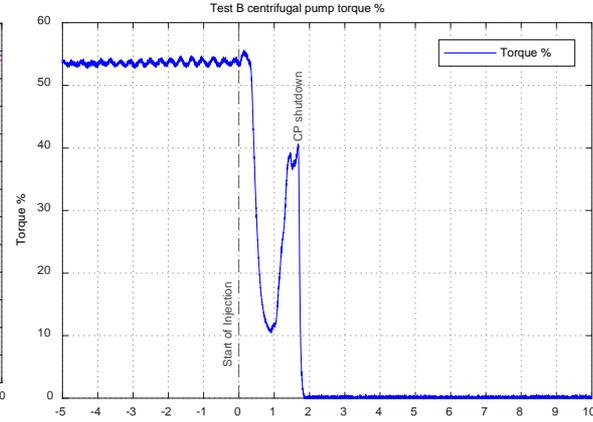

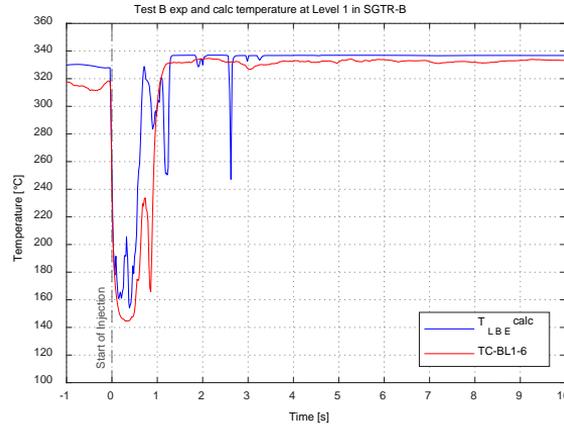

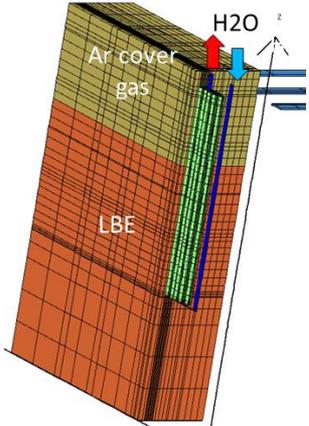

Test matrix	Test #1 SGTR-A	Test #2 SGTR-C	Test #3 SGTR-B	Test #4 SGTR-D
LBE temperature [°C]	350	350	350	350
LBE cover gas pressure [bar]	0.05	0.05	0.05	0.05
LBE flow rate (kg/s)	60-65	75	80	75
Water temperature [°C]	182	190	192	195
Water pressure [bar]	16.3	17	16.5	16.9
Water flow rate (g/s)	65	74	73	72
Centrifugal pump head [bar]	2	2.2	3.1	2.7
Rupture position	Middle	Middle	Bottom	Bottom
Rupture occurrence in right position (by TC analysis)	Yes	Yes	Yes	Yes
Injection time [s]	5	5	5	5
Max water mass flow rate [g/s]	120	130	130	135
Max CIRCE pressurization [bar]	2.6	2.7	3.6	3.7
Rupture disc activation	Yes	Yes	No	No
LBE in 3/4 inch discharge line	No	No	Yes	Yes

# Heat Transfer in LEAD

Liquid metals have Prandtl numbers that are **lower than the unity**, as can be seen in the following table

<i>Coolant</i>	<i>Prandtl number</i>	
Water	6.82 (21 °C, 1bar)	1.06 (PWR)
Liquid metals	0.004 – 0.04	

(a) ORDINARY FLUID

(b) LIQUID METAL

Comparison of thermal ( $\delta_t$ ) and hydrodynamic ( $\delta_h$ ) boundary layers for ordinary fluids vs liquid metals.

Due to the large thermal and small viscous diffusivity (low Prandtl number) the momentum and temperature fields are non-similar, so that the turbulent heat flux models based on the Reynolds analogy cannot be applied to liquid metals.

Indeed, in a liquid metal, **the thickness of the thermal boundary layer is significantly larger than the thickness of the hydrodynamic boundary layer.**

# Heat Transfer in LEAD

- For calculation of the heat transfer from the fuel rod surfaces to the coolant **correlations are necessary**

The value of h (or HTC) is dependent by many factors:

1. The geometrical shape of the channel
2. The flow rate of the coolant
3. The heat flux
4. The system temperature

The correlations for the HTC include the dependence from Nusselt number which is generally a function of Reynolds number and Prandtl number.

$$\text{Nu} = f(\text{Re}, \text{Pr})$$

$$\text{Convection/Conduction} \quad \text{Nu} = a + b \cdot \text{Pe}^c$$

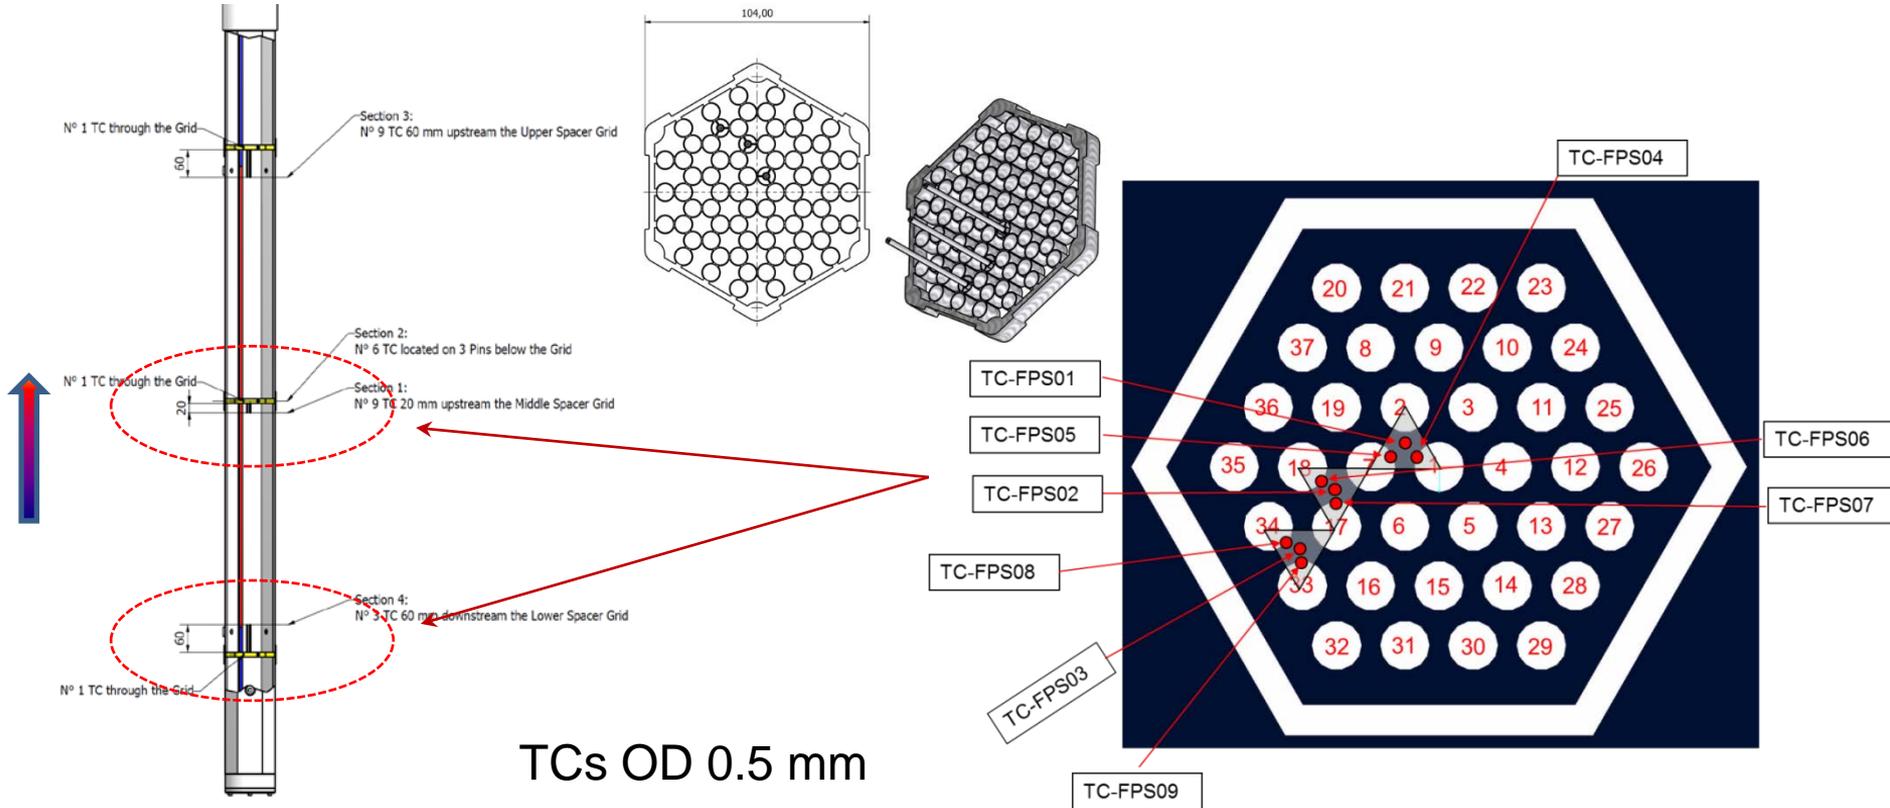

$$\text{Re} = (\text{De } w \rho) / \mu$$

Inertia force / Viscous force

$$\text{Pr} = \nu/\alpha = (c_p \mu) / k$$

Diffusion of momentum /Diffusion of heat
