International Conference on Human and Organizational Aspects of Assuring Nuclear Safety –Exploring 30 Years of Safety Culture

Contribution ID: 109

Type: Poster

Study on the Man-Machine-Organization System Interfaces in Nuclear Facility Operation

Tuesday 23 February 2016 10:20 (30 minutes)

Synopsis

The nuclear installations are complex socio-technical systems whose reliable operation is based on the success both of the technical equipment and of the human and organizational factors. In this paper a theoretical study of the interfaces in Man –Machine - Organization System (MMOS) was performed. So,in this phase were performed the following:

- The identification of the characteristics of each element (man, machine, organization)

- The identification and the analyzing of the man-machine interfaces (equipment)

- The identification and the analyzing of the man-organization interfaces (communication, procedures, work process, training, time, work environment). So that for each interface was developed a circumstances module which can influence positive or negative the MMOS performance in accident conditions.

- The identification and the analyzing of the machine -organization interfaces (maintenance plan, modification plan, management of aging, state of man-machine interfaces). So that for each interface was developed a circumstances module which can influence positive or negative the MMOS performance in accident conditions.

All interfaces identified in MMOS and the conditions which could be at any given time are in the database records (HUFAD_E –Human Factor Analysis Database _English). This database was developed in Microsoft Visual Basic 6.0 environment using SQL language query relational database.

Using the results of the studies, developed database and a software application (it was developed in Microsoft Visual Basic 6.0) a new approach (MMOSA) was developed. This method contents the following phases: the investigation process of the human actions; the appraisal of the possible human errors; the estimation of Basic Human Error Probabilities (BHEP) from generic or/and specific database; the estimation of Conditional Human Error Probabilities (CHEP) by the determination of the dependence level between actions using a positive dependence model; the comprehension of the human actions in MMOS to identify the MMOS interfaces using our qualitative analysis model and the database (the positive or negative conditions which can influence the human action at the analysis moment are identified for each interface); the estimation of the human error probabilities (HEP); the documentation (it is a report which will contain all elements considered in analysis and all results to be incorporated both in PSA study and design process).
