26th IAEA Fusion Energy Conference - IAEA CN-234

Contribution ID: 340 Type: Poster

Ion heating in magnetosphere plasma device RT-1

Wednesday, 19 October 2016 08:30 (4 hours)

While the stable high-beta ($\tilde{}$ 1) confinement by a dipole magnetic field was successfully demonstrated with high-temperature electrons (Te > 10 keV) [1, 2], the heating of ions was a challenge. We have made two major progresses in this direction. (i) We developed a system for ion cyclotron resonance of frequency (ICRF) heating, and demonstrated the active heating of ions by launching a slow wave. The ion temperatures in the core region are increased in hydrogen, helium and deuterium plasmas. The differences of temperatures among ion species suggest a strong influence of the charge-exchange loss by which the bulk ions remain relatively cold (< 20 eV) in comparison with impurity ions. (ii) We also found a spontaneous heating mechanism concomitantly occurring with the up-hill diffusion [3, 4].

Paper Number

EX/P3-47

Country or International Organization

Japan

Primary author: Dr NISHIURA, Masaki (The University of Tokyo)

Co-authors: Mr KASHYAP, Ankur (The University of Tokyo); Prof. FUKUYAMA, Atsushi (Kyoto University); Mr SAITOH, Haruhiko (University of Tokyo); Mr NAKATSUKA, Masataka (The University of Tokyo); Ms YAMASAKI, Miyuri (The University of Tokyo); Mr TAKAHASHI, Noriki (The University of Tokyo); Mr MUSHI-AKE, Toshiki (The University of Tokyo); Dr KAWAZURA, Yohei (The University of Tokyo); Dr YANO, Yoshihisa (The University of Tokyo); Prof. YOSHIDA, Zensho (The University of Tokyo)

Presenter: Dr NISHIURA, Masaki (The University of Tokyo)

Session Classification: Poster 3

Track Classification: EXS - Magnetic Confinement Experiments: Stability
