

# **Overview of Fuel Inventory in JET with the ITER-Like Wall**

#### Anna Widdowson

E. Alves, A. Baron-Wiechec, N.P. Barradas, N. Catarino, J.P. Coad, V. Corregidor, K. Heinola, S. Koivuranta, S. Krat, A. Lahtinen, J. Likonen, G.F. Matthews, M. Mayer, P. Petersson and M. Rubel and JET Contributors

This work has been carried out within the framework of the EUROfusion Consortium and has received funding from the Euratom research and training programme 2014-2018 under grant agreement No 633053. The views and opinions expressed herein do not necessarily reflect those of the European Commission.

- JET ITER-like wall (JET-ILW) operates with ITER relevant plasma facing components (PFCs)
  - Beryllium (Be) in the main chamber
  - Tungsten (W) in the divertor
- ITER relevant samples for *post mortem* analysis
  - Long term fuel retention assessment
  - Material migration studies
  - Detritiation studies
- No active cooling and use of W coatings on some PFCs

#### **JET-ILW campaign parameters**

	ILW-1: 2011-2012	ILW-2: 2013-2014	
Limiter phase	6 hours	6 hours	
Divertor phase	13 hours	14 hours	
Hydrogen (H) campaign	None	0.6 hours	
Inner strike point	Predominantly Tile 3	Predominantly Tile 4	
Outer strike point	Predominantly Tile 5	Predominantly Tile 6	

JE1

#### Post mortem analysis

Post mortem analysis of samples removed from JET-ILW enable the study of longterm fuel/deuterium (D) retention and material migration

- Poloidal set of main chamber tiles
   (
- Poloidal set of divertor tiles (
- Analysis of individual tiles show local fuel retention of material migration
- Extrapolation from individual tile analysis is used to assess global long term fuel retention in JET

#### JET-ILW Plasma Facing Components (PFCs) 25 µm tungsten (W

Bulk Be PFCs Bulk W Be- coated inconel PFCs W- coated CFC PFCs

![](_page_4_Picture_4.jpeg)

Bulk beryllium (Be) Castellated structure 25 μm tungsten (W) coating on carbon-fibre composite (CFC) tile

![](_page_4_Picture_7.jpeg)

Bulk tungsten (W) Lamellae structure

Anna Widdowson | IAEA-FLO | Ryolo, Japan | October 2010 | Flage J

#### **Analysis methods**

![](_page_5_Picture_1.jpeg)

Fuel retention study	Erosion deposition study	Analysis depth (µm)	Technique
D	Be, C	10	Nuclear Reaction Analysis (NRA)
D	Be, W, Mo	50	Secondary ion mass spectrometry (SIMS)
HD, D <sub>2</sub> , DT, T <sub>2</sub> ,	Be	bulk	Thermal desorption spectroscopy (TDS)
D	Be and heavier	10	Rutherford/Elastic backscattering spectroscopy (RBS/EBS)
D	O,C,N	10	Elastic recoil detection analysis (ERDA)

- Large international effort EUROfusion Work Programme & EU-Japan Broader Approach
- Thousands of measured and analysed points, covering a fraction of 100 m<sup>2</sup> JET chamber area.
- Results provide direct measurement of material erosion, deposition and fuel retention.
- Examples illustrate key fuel retention and material migration results for JET-ILW.

#### **JET-ILW: terminology**

![](_page_6_Picture_1.jpeg)

![](_page_6_Figure_2.jpeg)

S-coordinate:

Distance along divertor surface in millimeters

Divertor tile numbering **HFGC(0)**, **1**, 3, 4, **5**, **6**, 7, 8, B, C

ILW-1: Tiles exposed during the first ITER-Like Wall Campaign 2011-12

ILW-2: Tiles exposed during the second ILW campaign 2013-14

ILW-1&2: Tiles exposed during both ILW campaigns

#### Mechanisms of long-term fuel retention

![](_page_7_Picture_1.jpeg)

Long-term fuel retention by:

Implantation in Be (or W) and Co-deposition with Be (or W)

![](_page_7_Figure_4.jpeg)

Co-deposition dominates fuel retention

![](_page_7_Picture_6.jpeg)

#### **Deposition at upper inner divertor**

![](_page_8_Picture_1.jpeg)

![](_page_8_Picture_2.jpeg)

![](_page_8_Picture_3.jpeg)

- Deposition after ILW-1 & 2 2011-2014 (2 campaigns)
- Plasma shadowed regions & deposition regions clearly visible

#### **Deposition at upper inner divertor**

![](_page_9_Picture_1.jpeg)

- Rough surface
- Deposition layer well adhered
- No flaking deposits or mobile dust
- Reduced dust/flake production

![](_page_9_Figure_6.jpeg)

- After ILW-1&2 approx. 40 µm Be-rich deposit formed at upper inner divertor.
- $\Rightarrow$  These are the only thick deposits found in JET-ILW.
- Be remains where it is first deposited.
- ⇒ No multistep erosionredeposition material migration for Be

Ashikawa Ex/P6-19, Grzonka/Fortuna-Zalesna Ex/P6-20

### Effect of H campaign on D retention

HFGC

SIMS depth profile of deposit exposed To H (Tile 0 HFGC ILW-1&2)

![](_page_10_Figure_3.jpeg)

- ILW-2 ended with hydrogen (H) pulses.
- Surface effect (~2 µm): Increased H and depletion of D from surface of deposits due to isotopic exchange in H campaign.
- Fuel concentration in thick deposits is similar for ILW-1 and ILW-2.
- Fuel retention from surfaces with thin or no deposits is reduced.
- Global fuel retention reduced by ending in H.

JET

#### **Outer divertor corner**

#### Comparison of tiles from ILW-1 and ILW-2

![](_page_11_Picture_2.jpeg)

![](_page_11_Picture_3.jpeg)

- 2-3 µm layered deposit after two campaigns
- Layers probably related to varying campaign parameters

![](_page_11_Picture_6.jpeg)

Cross sections from tile exposed ILW-1 & 2

![](_page_11_Picture_8.jpeg)

#### **Outer divertor corner**

![](_page_12_Picture_1.jpeg)

![](_page_12_Figure_2.jpeg)

- Material transport to outer divertor influenced by Outer Strike Point (OSP) location
- Localised band of Be deposition just beyond OSP for ILW-2
- Long range material migration to outer corner is low

![](_page_12_Figure_6.jpeg)

![](_page_12_Picture_7.jpeg)

#### **D** distribution on divertor surfaces

![](_page_13_Picture_1.jpeg)

ILW-1 2011-12

![](_page_13_Figure_2.jpeg)

Heinola, et al., Phys. Scr. T167 (2016) 014075

JE7

#### **D** distribution on divertor surfaces

![](_page_14_Picture_1.jpeg)

![](_page_14_Figure_2.jpeg)

Heinola, et al., Phys. Scr. T167 (2016) 014075

#### D & Be distribution on divertor surfaces

![](_page_15_Picture_1.jpeg)

#### ILW-1 2011-12

![](_page_15_Figure_3.jpeg)

a, et al., Phys. 30. 1107 (2010) 014075

JET

#### D & Be distribution on divertor surfaces

![](_page_16_Picture_1.jpeg)

![](_page_16_Figure_2.jpeg)

Heinola, et al., Phys. Scr. T167 (2016) 014075

**JET** 

#### D & Be distribution on divertor surfaces

![](_page_17_Picture_1.jpeg)

![](_page_17_Figure_2.jpeg)

JET

#### **JET-ILW: Bulk Tungsten Tile**

![](_page_18_Figure_1.jpeg)

![](_page_18_Figure_2.jpeg)

#### Bulk tungsten tile: ILW-1 2011-2012

![](_page_19_Picture_1.jpeg)

D

![](_page_19_Figure_2.jpeg)

• Deuterium concentration decreases from stack A to C

• Inversely proportion to temperature

• Fuel retention in bulk tungsten surface is factor 100 lower than in co-deposits

<1% of global fuel retention

• Be locally deposited on stack D associated with outer strike point location

![](_page_19_Figure_8.jpeg)

#### Fuel retention in Be castellation gaps

![](_page_20_Picture_1.jpeg)

![](_page_20_Picture_2.jpeg)

Distance from plasma-facing surface (µm)

- Gap width 0.4 mm
- Deposition and fuel retention in within first 1 mm of tile surface
- 7 km of castellations in JET Be tiles
  - 3% of global fuel retention
- Fuel inventory increases with gap width
   ⇒ KEEP GAPS NARROW TO REDUCE INVENTORY

![](_page_20_Figure_9.jpeg)

![](_page_20_Picture_10.jpeg)

Anna Widdowson | IAEA-FEC | Kyoto, Japan | October 2016 | Page 21

Rubel Ex/P6-1

### **Global fuel inventory ILW-1 2011-12**

![](_page_21_Picture_1.jpeg)

#### Total fuel inventory 38.8 x 10<sup>22</sup> D atoms

![](_page_21_Figure_3.jpeg)

Heinola et al., Phys. Scr. 2016 T167 014075, Rubel Ex/P6-1

![](_page_21_Picture_5.jpeg)

- Fuel retention in JET-ILW is
   0.3 % of injected D
- Fuel retention rate reduced by factor >18 compared with carbon wall
- 65% of global deuterium retention in divertor region
- ILW-2 (2013-14) assessment ongoing

### Material migration and fuel retention

![](_page_22_Picture_1.jpeg)

![](_page_22_Figure_2.jpeg)

- Sputtering of Be from recessed wall by low energy ions and charge exchange neutrals
- Transport of eroded Be in scrape off layer mainly to inner divertor

#### JET-ILW vs JET CARBON WALL

- Lower erosion in main chamber resulting in lower migration of material to the divertor
- Reduced chemical erosion of Be by D fuel
  - Reduced long range material migration to surfaces remote from the plasma

![](_page_22_Picture_9.jpeg)

### **ITER Outlook**

![](_page_23_Picture_1.jpeg)

### WallDYN deposition pattern for JET-ILW

![](_page_23_Figure_3.jpeg)

![](_page_23_Figure_4.jpeg)

**Deposition on Plasma Facing Materials** 

- WallDYN code is used to predict material migration and deposition in ITER.
- WallDyn reproduces deposition pattern at upper inner divertor.

Schmid Nucl. Fusion 55 2015

Retention is gaps potentially low

• Keep gaps narrow Rubel Ex/P6-1

Retention in bulk tungsten is low compared with codeposits

#### JET

### Summary

![](_page_24_Picture_1.jpeg)

- *Post mortem* analysis programme of JET-ILW plasma facing components continues to provide an insight into the long term fuel retention and material migration patterns.
- JET-ITER like wall demonstrates reduced fuel retention due to reduced overall deposition compared with an all carbon wall.
  - Optimistic results for ITER on retention in bulk tungsten surfaces and narrow gaps.
- Future analysis programme:-
  - Deposition build up, fuel retention and fuel release in key areas for JET operations up to 2016.

![](_page_24_Picture_7.jpeg)

### Thank you

![](_page_25_Picture_1.jpeg)

- Heinola, Phys. Scr. T159 (2014) 014013

### JET Dust collection: vacuuming

![](_page_26_Picture_1.jpeg)

![](_page_26_Figure_2.jpeg)

- Dust collection by vacuuming from JET tile surfaces
- <2g dust collected after ILW-1 and ILW-2</li>
  - Significantly less that collected from the JET carbon wall (~200 g)
- Fuel inventory in dust insignificant

Ashikawa P6-19, Grzonka/Fortuna-Zalesna P6-20

### Be deposition at upper inner divertor

![](_page_27_Figure_1.jpeg)

![](_page_27_Figure_2.jpeg)

#### NRA/EBS analysis

- Distribution of deposit at inner divertor influenced by inner strike point location.
- Scrape off layer (SOL) extends further down Tile 1 in ILW-2.
- ⇒ Deposition extends further down Tile 1 surface after ILW-2 compared with ILW-1.

#### Predominant inner strike point location

![](_page_27_Picture_8.jpeg)

![](_page_27_Picture_9.jpeg)

### D distribution on inner wall limiter

![](_page_28_Figure_1.jpeg)

G. Arnoux, Phys. Scripta T159, 014009 (2014)
K. Heinola, Phys. Scripta T159, 014013 (2014)
A. Baron-Wiechec, J. Nucl. Mat.463, 157 (2015)

![](_page_28_Figure_3.jpeg)

- Fuel inventory on limiter tiles associated with limiter plasma operations
- Fuel retention is mainly by codeposition at ends of tiles
- Very low D content in areas of high thermal loads
- ITER limiter plasma time will be short compared with divertor plasma time, therefore main chamber codeposition and fuel retention reduced

#### Be inner limiter tile

![](_page_29_Figure_1.jpeg)

![](_page_29_Figure_2.jpeg)

- Erosion at inner limiter during limiter phase
- Fuel retention dominated by local co-deposition of eroded material at ends of limiter tiles

![](_page_29_Picture_5.jpeg)

## Effect of impurities and temperature on fuel retention

![](_page_30_Picture_1.jpeg)

![](_page_30_Figure_2.jpeg)

### **Deposition at upper inner divertor**

SIMS depth profile in deposit on HFGC ILW-1&2 2011-14

![](_page_31_Figure_2.jpeg)

![](_page_31_Picture_3.jpeg)

- SIMS data provides thickness data
- Deuterium (D) penetrates to porous tungsten coating
- Quantification of D in coating ongoing
- ⇒ Specific to JET-ILW tungsten coated CFC tiles

#### **Global retention summary**

![](_page_32_Picture_1.jpeg)

Divertor	Inventory	Main chamber	Inventory		
Tungsten	(10 <sup>22</sup> D atoms)	Beryllium	(10 <sup>22</sup> D atoms)		
Plasma facing surfaces					
Inner divertor*	17	Inner limiters*	1.4		
Outer divertor*	3.9	Outer limiters*	5.2		
Bulk tungsten <sup>†</sup>	0.3	Dump plate*	2.1		
Recessed/remote surfaces and gaps					
Inner corner*	2.0	Inner wall*	2.8		
Outer corner*	2.2	Outer wall*	0.9		
		Castellation gaps <sup>‡</sup>	1.0
