

Multi-species ITG-TEM driven turbulent transport of D-T ions and He-ash in ITER burning plasmas : TH/P2-2

*M. Nakata (NIFS), M. Honda, M. Nunami, T. -H. Watanabe, and H. Sugama

D-T fuel ratio & He-ash accum.
dependence of D- and T-fluxes

Profile gradient dependence of D-,
T-, He-, e-fluxes and heat fluxes

Multi-species ITG-TEM turbulence sim. for ITER D-T-He plasma are carried out by GKV, then we found

- (i) imbalanced D-T particle transport strongly influenced by He-ash accumulations.
- (ii) several profile regimes satisfying Reiter's steady burning condition: $\tau_{He} < \alpha^* \tau_E$.
