

- Lower heat transport in flux-driven gyrokinetics
- Edge is not a mere bound. condition for core

Flux- vs gradient-driven transport:

- **non-vanishing marginal turbulent transport:** shrunk 'Dimits upshift'
- **lower transport at increased drive R/L_T due to $\mathbf{E} \times \mathbf{B}$ staircase**

- **spreading of turbulence from core to edge is not significant**
- **edge turbulence impacts deep core transport & fluctuation levels**
