## **Simulations of Runaway Electron Generation including Hot-Tail Effect**

*Tuesday, 18 October 2016 08:30 (4 hours)*

The suppression and mitigation of runaway electron (RE) is an urgent issue of large scale tokamak operation. The contribution of hot-tail effect, which arises from the fast thermal quench, is studied using Fokker-Planck simulation. It is found that if the thermal quench is fast enough to invoke the hot-tail effect, it may produce seed REs and enhance total RE current even in a high electron density plasma.

### **Paper Number**

TH/P1-37

### **Country or International Organization**

Japan

**Primary author:** Dr NUGA, Hideo (Kyoto University)

**Co-authors:** Dr MATSUYAMA, Akinobu (Japan Atomic Energy Agency); Prof. FUKUYAMA, Atsushi (Kyoto University); Dr YAGI, Masatoshi (Japan Atomic Energy Agency)

**Presenter:** Dr NUGA, Hideo (Kyoto University)

**Session Classification:** Poster 1

**Track Classification:** THS - Magnetic Confinement Theory and Modelling: Stability
