Ion Kinetic Dynamics in Strongly-Shocked Plasmas Relevant to ICF

Thursday, 20 October 2016 15:20 (20 minutes)

Implosions of thin-shell capsules produce strongly-shocked ($M > 10$), low-density ($\rho \sim 1$ mg/cc), high-temperature ($T \sim \text{keV}$) plasmas, comparable to those produced in the strongly-shocked DT-vapor in inertial confinement fusion (ICF) experiments. A series of thin-glass targets was filled with mixtures of deuterium and Helium-3 gas ranging from 20% to 100% deuterium and imploded on the OMEGA laser at the Laboratory for Laser Energetics to investigate the impact of multi-species ion kinetic mechanisms on ICF-relevant plasmas. Anomalous trends in nuclear yields and burn-averaged ion temperatures, which have been interpreted as signatures of ion species separation and ion thermal decoupling [H. G. Rinderknecht et al., Phys. Rev. Lett. 114, 025001 (2015)], are found not to be consistent with single-species ion kinetic effects alone. Experimentally-inferred Knudsen numbers predict an opposite yield and temperature trend to those observed, confirming the dominance of multi-species physics in these experiments. Ion density is inferred to be half of the predicted value: models of undercompression and loss of ions at the fuel/ablator interface are considered. The impact of the observed kinetic physics mechanisms on the formation of the hotspot in ICF experiments is discussed.

Paper Number

IFE/1-5

Country or International Organization

United States of America

Primary author: RINDERKNECHT, Hans (Lawrence Livermore National Laboratory)

Co-authors: Dr ZYLSTRA, Alex (Los Alamos National Laboratory); Dr LI, Chikang (MIT); Dr STOECKL, Christian (Laboratory for Laser Energetics); Dr SANGSTER, Craig (Laboratory for Laser Energetics); Dr SEGUIN, Fredrick (Massachusetts Institute of Technology); Dr KAGAN, Grisha (Los Alamos National Laboratory); Mr SIO, Hong (Massachusetts Institute of Technology); Dr FRENJE, Johan (Massachusetts Institute of Technology); Dr GATU JOHNSON, Maria (Massachusetts Institute of Technology); Dr ROSENBERG, Michael (Laboratory for Laser Energetics); Dr HOFFMAN, Nelson (Los Alamos National Laboratory); Dr LARROCHE, Olivier (Commissariat à l'Energie Atomique); Dr AMENDT, Peter (Lawrence Livermore National Laboratory); Dr PETRASSO, Richard (Massachusetts Institute of Technology); Dr WILKS, Scott (Lawrence Livermore National Laboratory); Dr GLEBOV, Vladimir (Laboratory for Laser Energetics)

Presenter: RINDERKNECHT, Hans (Lawrence Livermore National Laboratory)

Session Classification: Inertial Fusion Experiments & Theory

Track Classification: IFE - Inertial Fusion Experiments and Theory
